This online-only document was published at a cost of $\$ 33,533$. This document was published for the Louisiana Department of Education, P.O. Box 94064, Baton Rouge, LA 70804-9064, by Data Recognition Corporation, 13490 Bass Lake Road, Maple Grove, MN 55311. This material was printed in accordance with the standards for printing by State Agencies established pursuant to R.S. 43:31.

## Table of Contents

Executive Summary ..... 6
E. 1 Overview of This Report ..... 6
E. 2 Administration ..... 7
E. 3 Student Performance ..... 8
E. 4 Validity and Test Scores ..... 8
Chapter 1: Introduction ..... 10
1.1 Background ..... 10
1.2 Purpose of the LEAP 2025 ..... 10
1.3 Design of the LEAP 2025 ..... 11
Chapter 2: The Uses of Test Scores ..... 14
2.1 Uses of Test Scores ..... 14
2.2 Test-Level Scores ..... 14
2.3 Scale Scores ..... 15
2.4 Levels of Achievement ..... 15
2.5 Use of Test-Level Scores ..... 15
2.6 Category- and Subcategory-Level Subscores ..... 15
2.7 Use of the Reporting Category- and Subcategory-Level Ratings ..... 16
Chapter 3: Test Content Development ..... 17
3.1 Defining the Specific Test Blueprint ..... 19
3.2 English Language Arts Test Blueprints and Test Designs ..... 19
3.3 Mathematics Test Blueprints and Test Designs ..... 29
3.4 Item Development and Selection ..... 42
3.5 Considerations of Test Fairness in Item Development ..... 42
3.6 New Meridian Item Reviews ..... 42
3.7 Operational Test Selection ..... 43
3.8 Universal Design ..... 43
3.9 Accommodations and Designated Supports ..... 45
3.10 Item and Task Specifications ..... 46
3.11 Summary ..... 47
Chapter 4: Test Administration ..... 49
4.1 Return Material Forms and Guidelines ..... 55
4.2 Security Checklists ..... 55
4.3 Interpretive Guides ..... 58
4.4 Test Security Measures ..... 58
4.5 Data Forensic Analyses ..... 58
4.5.1 Response Change Analysis ..... 58
4.5.2 Score Fluctuation Analysis ..... 58
4.5.3 Item Exposure Monitoring ..... 59
4.5.4 Web Monitoring ..... 59
4.5.5 Plagiarism Detection ..... 59
4.6 Test Administration ..... 59
4.6.1 Time ..... 59
4.6.2 Accommodations ..... 60
4.7 Summary ..... 65
Chapter 5: Scoring of Constructed-Response and Technology-Enhanced Items ..... 67
5.1 Constructed-Response Item Scoring Process ..... 67
5.1.1 Selection of Scoring Evaluators ..... 68
5.1.2 Security ..... 68
5.1.3 Handscoring Training Process ..... 69
5.1.4 Monitoring the Scoring Process ..... 73
5.2 Inter-Rater Reliability ..... 75
5.3 Multiple-Choice and Multiple-Select Item Scoring Process ..... 81
5.4 Summary ..... 81
Chapter 6: Operational Data Analyses ..... 83
6.1 Test-Level Statistics ..... 83
6.2 Item-Level Statistics. ..... 85
6.3 Item Response Theory ..... 109
6.4 Calibration and Linking ..... 109
6.5 Summary ..... 128
Chapter 7: Test Results ..... 129
7.1 Current Administration Data ..... 136
7.1.1 Description of Each Type of Report ..... 139
Chapter 8: Performance-Level Setting ..... 141
8.1 PARCC Performance-Level Setting Process for English Language Arts and Mathematics ..... 141
8.2 Cut Scores ..... 141
8.2.1 Reporting Category Cut Scores ..... 142
8.3 Summary ..... 143
Chapter 9: Evidence of Validity ..... 144
9.1 Construct-Irrelevant Variance and Construct Underrepresentation ..... 145
9.2 Reliability ..... 145
9.2.1 Test Reliability ..... 146
9.2.2 Standard Error of Measurement ..... 147
9.2.3 Conditional Standard Error of Measurement ..... 147
9.2.4 Classification Accuracy and Consistency ..... 152
9.2.5 Convergent Validity. ..... 155
9.3 Principal Components Analysis ..... 156
9.4 Analyses by Reporting Categories and Subcategories ..... 158
9.4.1 Correlations among Reporting Categories and Subcategories ..... 158
9.4.2 Reliability of Reporting Categories and Subcategories ..... 163
9.4.3 Standard Error of Measurement of Reporting Categories and Subcategories ..... 164
9.5 Divergent (Discriminant) Validity ..... 168
9.6 Regression of LEAP 2025 from 2019 to 2021 ..... 168
9.7 Summary ..... 171
Chapter 10: Fairness ..... 173
10.1 Minimizing Bias through Careful Test Development. ..... 174
10.2 Evaluating Bias through Differential Item Functioning (DIF) Statistics ..... 174
10.2.1 DIF Statistics for Demographic Groups ..... 176
10.2.2 DIF Statistics for Test Language ..... 179
10.3 Evaluating Bias through Impact Analysis ..... 179
10.3.1 Reliability. ..... 180
10.3.2 Effect Size ..... 188
10.4 Mode Effect Study ..... 203
10.5 Summary ..... 204

## Executive Summary

This report is a technical summary of the 2021 administration of the Louisiana Educational Assessment Program (LEAP 2025) in English language arts (ELA) and mathematics for grades 3 through 8. The LEAP 2025 summative assessments in ELA and mathematics are administered in grades 3 through 8 and high school. These tests are designed to measure students' readiness for the next grade or course of study and proficiency in ELA and mathematics. The ELA and mathematics test forms were developed by Data Recognition Corporation (DRC) test development staff using the New Meridian item bank as well as items from the Louisiana Department of Education's own item bank. Items taken from these banks were on pre-established item response theory (IRT) scales. This section provides a summary of the 2021 operational technical report.

## E. 1 Overview of This Report

This technical report documents the major activities of the testing cycle and provides details that confirm that the processes and procedures applied in the LEAP 2025 assessments adhered to appropriate professional standards and practices of educational assessment. Ultimately, this report serves to document evidence that valid inferences about Louisiana student performance in ELA and mathematics can be derived from the LEAP 2025 assessments. An overview of major activities documented within this report is provided below.

## The Uses of Test Scores (Chapter 2)

Chapter 2 of the technical report discusses the concept of validity evidence. This technical report is composed of evidence that supports the intended uses of the LEAP 2025 test scores, and Chapter 2 discusses some of those uses.

## Test Content Development (Chapter 3)

Chapter 3 of the technical report provides a summary of the test development activities that occurred in order to create the spring 2021 operational test forms.

## Test Administration (Chapter 4)

Chapter 4 of the technical report describes the processes implemented and the information disseminated to help ensure standardized test administration procedures and, thus, uniform test administration conditions for students.

## Constructed-Response and Technology-Enhanced Scoring (Chapter 5)

Chapter 5 of the technical report describes the processes used to score constructed-response and technology-enhanced items. This chapter discusses how scorers are trained and the measures used to ensure consistency among scorers. Finally, this chapter presents the results of the inter-rater reliability studies.

## Operational Data Analyses (Chapter 6)

Chapter 6 of the technical report includes a detailed description of the operational data analyses of the 2021 LEAP 2025 assessments, which include the following major parts: the classical item analysis; calibration, scaling, and linking using IRT models; and student scoring.

## Test Results (Chapter 7)

Chapter 7 of the technical report contains information on the results of the spring 2021 LEAP 2025 assessments. Detailed summary statistics based on scale scores and information about achievement levels are also provided. Finally, this chapter presents information on the score reports sent to school systems.

## Performance-Level Setting (Chapter 8)

Chapter 8 of the technical report briefly discusses performance-level setting. It provides a brief overview of the procedures for performance-level setting and derivation of the cut scores used to classify students into achievement levels for ELA and mathematics.

## Evidence of Construct-Related Reliability (Chapter 9)

Chapter 9 of the technical report provides evidence of the reliability and validity of the LEAP 2025 test scores. This chapter provides detailed evidence of the reliability of the tests and information on the decision consistency of the cut scores. It also provides evidence of construct validity for the LEAP 2025 test scores.

## Fairness (Chapter 10)

Chapter 10 of the technical report discusses fairness and how the LEAP 2025 assessments are constructed to be fair to all Louisiana students. This chapter summarizes the results of the differential item functioning (DIF) analysis. It also discusses the results of an impact analysis designed to determine whether large differences exist with the test results of different demographic groups in Louisiana. The results of the administration mode study are also summarized.

## E. 2 Administration

In the spring of 2021, Louisiana administered the LEAP 2025 summative assessments in ELA and mathematics to students in grades $3-8$. A paper-based test (PBT) option was administered in grades 3 and 4 , and the computer-based test (CBT) was administered in grades 3-8. The CBTs were administered from April 26 to May 26, 2021. The PBTs were administered from April 28 to 30, 2021. Test administration is discussed in Chapter 4 of this report.

A total of 103 school systems and 32 charter schools administered the ELA and mathematics LEAP 2025 tests in grades 3-8. Table E. 1 shows participation rates based on census data. For the purposes of this report, participation rate is defined as the percentage of students who earned a valid scale score given the total number of students who were expected to take the test. The "Accountable" column shows the total number of students who were expected to take the test by grade and content area. The "Percentage Reportable" column shows the percentage of students who received a scale score on the LEAP 2025 by grade and content area. Further analysis of participation rates is provided in Chapter 7 of this report. The results presented in Table E. 1 and Chapter 7 are presented as evidence of reliability and validity of the scores from the LEAP 2025 assessments and should not be used for state accountability purposes.

Table E. 1 Participation Rates: All Students Participating in 2021 LEAP 2025 Grades 3-8

| Grade | Accountable in <br> ELA | Percentage <br> Reportable in ELA | Accountable in <br> Mathematics | Percentage <br> Reportable in <br> Mathematics* |
| :---: | :---: | :---: | :---: | :---: |
| 3 | $\geq 50,130$ | $98.75 \%$ | $\geq 50,540$ | $98.79 \%$ |
| 4 | $\geq 50,290$ | $98.67 \%$ | $\geq 50,590$ | $98.69 \%$ |
| 5 | $\geq 50,270$ | $98.95 \%$ | $\geq 50,270$ | $98.97 \%$ |
| 6 | $\geq 52,240$ | $98.50 \%$ | $\geq 52,240$ | $98.51 \%$ |
| 7 | $\geq 53,190$ | $98.24 \%$ | $\geq 53,210$ | $98.29 \%$ |
| 8 | $\geq 52,780$ | $98.31 \%$ | $\geq 52,820$ | $98.38 \%$ |

*Students in grade 8 who were enrolled in Algebra I had the option of taking the LEAP 2025 Algebra I assessment instead of the LEAP 2025 Grade 8 Mathematics test.

## E. 3 Student Performance

Tables E. 2 and E. 3 present the percentage of students in 2021 who were classified in each of the achievement levels for ELA and mathematics.

Table E. 2 Percentage of Students Classified in Achievement Levels Using 2021 Census Data: English Language Arts

| Grade | Unsatisfactory | Approaching <br> Basic | Basic | Mastery | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 19.3 | 19.0 | 23.1 | 33.4 | 5.2 |
| 4 | 13.7 | 19.1 | 25.7 | 32.3 | 9.3 |
| 5 | 10.7 | 24.0 | 28.1 | 32.7 | 4.4 |
| 6 | 12.1 | 26.1 | 28.3 | 28.7 | 4.9 |
| 7 | 13.4 | 18.3 | 26.2 | 29.1 | 13.0 |
| 8 | 14.3 | 16.4 | 25.2 | 34.9 | 9.2 |

Table E. 3 Percentage of Students Classified in Achievement Levels Using 2021 Census Data: Mathematics

| Grade | Unsatisfactory | Approaching <br> Basic | Basic | Mastery | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 18.2 | 22.9 | 25.3 | 28.3 | 5.3 |
| 4 | 20.0 | 23.1 | 25.2 | 29.7 | 2.1 |
| 5 | 18.5 | 28.6 | 26.7 | 23.2 | 3.1 |
| 6 | 18.8 | 27.9 | 28.9 | 21.9 | 2.5 |
| 7 | 12.0 | 33.0 | 32.6 | 20.5 | 1.9 |
| 8 | 27.3 | 25.8 | 25.2 | 20.2 | 1.5 |

More information on student performance may be found in Chapter 7 of this report.

## E. $4 \quad$ Validity and Test Scores

Most sections of this technical report are designed to provide validity evidence to support the intended uses of the LEAP 2025 test scores. Chapter 2 discusses the intended uses of the LEAP 2025 test scores. Chapter 3
discusses the test development process used to create the LEAP 2025 tests, which is important to the content-related validity of the LEAP 2025 test scores. Chapter 4 presents information on test administration. Chapter 5 discusses the scoring process and the results of the inter-rater reliability studies. Chapter 6 presents the test scaling and linking procedures, student scoring methodology, and the results of other operational data analyses. Chapter 7 reviews the results of the 2021 administration and gives an overview of the score reports that were electronically delivered to the school systems for distribution to schools and parents. Chapter 8 highlights the procedures for performance-level setting implemented by Partnership for Assessment of Readiness for College and Careers (PARCC), which were used because PARCC's standards and achievement levels were used for the LEAP 2025. Chapter 9 discusses reliability and construct-related validity. Chapter 10 gives an overview of the statistical processes used to evaluate bias to ensure fairness of the LEAP 2025 for all examinees.

## Chapter 1: Introduction

The LEAP 2025 assessment system is designed to measure students' knowledge of ELA, mathematics, science, and social studies. This report provides a technical overview of the LEAP 2025 ELA and mathematics assessments administered in grades 3 through 8 in the spring of 2021 and presents evidence for the validity of the 2021 LEAP 2025 ELA and mathematics assessment scores.

This chapter describes the background, purpose, and design of the LEAP 2025.

### 1.1 Background

In 2010, the Board of Elementary and Secondary Education (BESE) approved the Common Core State Standards (CCSS) in ELA and mathematics. After adopting the CCSS, Louisiana became a governing member of PARCC, a group of states working to develop high-quality assessments that measure the full range of the CCSS.

To prepare for the PARCC assessments and help ease the transition to the new standards, the Louisiana Department of Education (LDOE) incrementally revised the LEAP and iLEAP ELA and mathematics assessments in grades 3 through 8 and administered transitional tests during the 2012-2013 and 2013-2014 school years.

In the 2014-2015 school year, students in grades 3-8, except those qualifying for the LEAP Alternate Assessment, Level 1 (LAA 1), took the PARCC assessments for ELA and mathematics, which included two components: the performance-based assessment (PBA), which was administered in March, and the end-ofyear assessment (EOY), which was administered in May.

As a result of a legislative agreement reached during the summer of 2015, and to maintain comparability to the 2015 assessments, the LEAP ELA and mathematics assessments in grades 3-8 for the 2015-2016 school year consisted of items taken from both the PARCC assessments (no more than 49.9\%) and DRC's College and Career Readiness item bank.

In March 2016, BESE approved the Louisiana Student Standards in ELA and mathematics. In the 2016-2017, 2017-2018, 2018-2019, and 2020-2021 school years, students in grades 3-8, except those qualifying for an alternate assessment for students with the most significant cognitive disabilities (the LAA 1 in 2016-2017 or LEAP Connect in in subsequent years), were administered forms for ELA and mathematics that consisted of New Meridian (formerly PARCC) assessment items while developing some Louisiana-owned items to enhance the New Meridian item bank. This allowed for the continued comparability to forms administered in the 2014-2015 and 2015-2016 school years. Louisiana received approval from the federal and state governments to waive the requirement to adminsiter the spring 2020 assessment due to school facilities closing in March 2020 due to COVID-19.

The information that follows describes the technical aspects of the 2021 LEAP 2025 ELA and mathematics assessments and provides information about how to read and interpret the data.

### 1.2 Purpose of the LEAP 2025

The BESE and the LDOE are committed to ensuring that every student is on track to be successful in either postsecondary education or the workforce through their comprehensive plan Believe to Achieve (www.louisianabelieves.com/resources/about-us/believe-to-achieve). The LEAP 2025 supports this vision by measuring the full range of student performance and providing information for educators and parents about student readiness for college and careers.

### 1.3 Design of the LEAP 2025

Students in grades 3-8 were administered computer-based tests (CBTs) in both ELA and mathematics; some school systems opted to administer paper-based tests (PBTs) to students in grades 3 and 4. All mathematics assessments were translated into Spanish forms. Additionally, a braille form was available for each grade and content area. The braille form was based on the PBT in grades 3 and 4 and was based on the CBT in grades 58. Online tools allowed students to magnify assessment items, as needed, and students with visual impairments could also take large-print versions of the PBTs. See Chapter 3, Section 3.4 for more information about the accommodations and designated supports available for students taking the LEAP 2025.

The 2021 LEAP 2025 test blueprints and test design for ELA and mathematics are based on the ELA https://resources.newmeridiancorp.org/ela-test-design/ and mathematics
https://resources.newmeridiancorp.org/math-test-design/ blueprints of New Meridian's full forms. The 2021 LEAP 2025 test blueprints and test design for ELA and mathematics differ from the New Meridian blueprints and design in order to reduce testing time while maintaining full coverage and including a variety of standards.

The 2021 LEAP 2025 ELA blueprints kept a similar design as the design of New Meridian's full form, which includes both performance-based tasks and stand-alone passage sets, and a higher percentage of reading points to writing points. However, only two of the three types of performance tasks-Research Simulation Task and Literary Analysis Task or Narrative Writing Task—are included on each of the grade-level tests. All three task types are represented across grades 3-8, which allows Louisiana flexibility in the choice of the tasks administered for each grade from year to year and encourages teachers to focus equally on all three writing types. Besides having two (instead of three) performance tasks, the 2021 LEAP 2025 Spring ELA blueprints are also different with respect to testing time and percentage of reading and writing points. Since the choice of Literary Analysis Task or Narrative Writing Task is determined during the forms construction process, alternative blueprints—one with a Literary Analysis Task and a Research Simulation Task and the other with a Research Simulation Task and a Narrative Writing Task-were created for each grade's assessment.

The passages chosen for the 2021 LEAP 2025 ELA assessments contain a variety of text types, including texts that diverse populations will find engaging and that have a balance of gender and ethnicity among authors. Chosen passages are authentic, contain a variety of different genres and varying degrees of text complexity, and are content-rich, engaging, high-quality, and challenging. Additionally, paired passages are selected with careful consideration of the purpose of the standards that require the use of more than one text to be assessed. This combination of criteria during passage selection allows students to demonstrate their ability to read and comprehend a range of complex texts. With respect to an overall passage set and form, the goal is to ensure as much coverage of standards as possible.

The LEAP 2025 ELA assessments focus on an integrated approach to reading and writing that reflects instruction in an effective ELA classroom and measures students' ability to understand what they read and express that understanding in writing. This means careful, close reading of complex grade-level literary and informational texts; a full range of texts from across the disciplines, including science, social studies, and the arts; tasks that integrate key ELA skills by asking students to read texts, answer reading and vocabulary questions about the texts, and then write using evidence from what they have read; questions worth answering, ordered in a way that builds meaning; a focus on students citing evidence from texts when answering questions about a specific passage or when writing about a set of related passages; and a focus on words that matter most in texts, are essential to understanding a particular text, and include context that allows students to determine literal and figurative meanings.

In mathematics, the test blueprints are similar to those of New Meridian's test design with a few notable exceptions:

- In grades 3-5, the LEAP 2025 blueprints make use of three sessions with a total testing time of 235 minutes, instead of four sessions with a total testing time of 240 minutes.
- In grade 3, the difference in items is a reduction of 1 Type II item worth 4 points and an increase of 2 Type I items worth 1 point with a corresponding decrease of 1 Type I item worth 2 points. Therefore, the total number of items is the same across both designs, but LEAP 2025 has 4 fewer points.
- In grades 4 and 5, there is a bigger difference, as LEAP 2025 uses the same test design for grades 3-5, so the increase in type I 1-point items is 8 with a decrease in 4 2-point items in addition to the reduction of 1 Type II item worth 4 points.
- In grades 6-8, both assessment designs have three sessions and a total testing time of 240 minutes. However, New Meridian uses three sessions of equal testing time with 80 minutes each, while LEAP 2025 has a shorter non-calculator session 1 ( 60 minutes) followed by two 90-minute calculator sections. New Meridian has a split session in grade 7 mathematics for session 1 in which the noncalculator and calculator sections are split within the same session/unit. In grades 6 and 8 , the entire first session/unit is designated as non-calculator. The LEAP 2025 test design has consistency across grades 6-8 in testing time per session and has either non-calculator or calculator as the designation for the entire session for ease of administration.
- In grades 6 and 7, the LEAP 2025 design uses 8 more type I items worth 1 point, 2 fewer type I items worth 2 points, and 1 fewer type I item worth 4 points. (LEAP 2025 does not use any type I items worth 4 points.) Grades 6-8 use the same number of type II and III items in both test designs.
- LEAP 2025 uses the same test design for grade 8, so there are 8 more type I items worth 1 point and 2 fewer type I items worth 4 points (but the same number of type I items worth 2 points).

The LEAP 2025 mathematics assessments focus on testing the Louisiana Student Standards for Mathematics (LSSM) according to the components of rigor reflected in high-quality mathematics instructional tasks that

- require students to demonstrate understanding of mathematical reasoning in mathematical and applied contexts;
- assess accurate, efficient, and flexible application of procedures and algorithms;
- rely on application of procedural skill and fluency to solve complex problems; and
- require students to demonstrate mathematical reasoning and modeling in real-world contexts.

The LSSM support students to become mathematically proficient by focusing on three components of rigor: conceptual understanding, procedural skill and fluency, and application.

- Conceptual understanding refers to understanding mathematical concepts, operations, and relations. It is more than knowing isolated facts and methods. Students should be able to make sense of why a mathematical idea is important and the kinds of contexts in which it is useful. It also allows students to connect prior knowledge to new ideas and concepts.
- Procedural skill and fluency is the ability to apply procedures accurately, efficiently, and flexibly. It requires speed and accuracy in calculation while giving students opportunities to practice basic skills. Students' ability to solve more complex application tasks is dependent on procedural skill and fluency.
- Application provides a valuable context for learning and the opportunity to solve problems in a relevant and a meaningful way. It is through real-world application that students learn to select an
efficient method to find a solution, determine whether the solution(s) makes sense by reasoning, and develop critical thinking skills.

Each item on the LEAP 2025 mathematics assessment is referred to as a task and is identified by one of three types: Type I, Type II, or Type III. The tasks on the LEAP 2025 mathematics test are aligned directly to the LSSM for all reporting categories.

- Type I tasks, designed to assess conceptual understanding, fluency, and application, are aligned to the major, additional, and supporting content for each grade. Some Type I tasks may be further aligned to LEAP 2025 evidence statements for the Major Content and Additional \& Supporting reporting categories and allow for the testing of more than one of the student standards on a single task.
- Type Il tasks are designed to assess student reasoning ability of selected major content for the grade or the previous grade in applied contexts.
- Type III tasks are designed to assess student modeling ability of selected content for the grade or the previous grade in applied contexts. Type II and III tasks are further aligned to LEAP 2025 evidence statements for the Expressing Mathematical Reasoning and Modeling \& Application reporting categories.

Each of the three task types is aligned to one of four reporting categories: Major Content, Additional \& Supporting Content, Expressing Mathematical Reasoning, or Modeling \& Application. Each task type is designed to align with at least one of the Louisiana Student Standards for Mathematical Practice (MP).

Additional details about the design of the ELA and mathematics assessments can be found in Chapter 3.

## Chapter 2: The Uses of Test Scores

Validity is the central component of any analysis of the LEAP 2025 assessments. The following excerpt is from the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014):

Ultimately, the validity of an intended interpretation of test scores relies on all the available evidence relevant to the technical quality of a testing system. Different components of validity evidence . . . include evidence of careful test construction; adequate score reliability; appropriate test administration and scoring; accurate score scaling, equating, and standard setting; and careful attention to fairness for all test takers, as appropriate to the test interpretation in question (22).

As stated by the Standards, the validity of a testing program hinges on the use of the test scores. Validity evidence that supports the uses of the LEAP 2025 test scores is provided in this technical report. This chapter examines some possible uses of the LEAP 2025 test scores. However, this technical report cannot anticipate all possible interpretations and uses of the LEAP 2025 test scores.

### 2.1 Uses of Test Scores

To understand whether a test score is being used properly, one must understand the purpose of the test. The intended uses of the LEAP 2025 test scores include the following:

- evaluating students' overall proficiency of the Louisiana Student Standards
- identifying students' strengths and weaknesses
- evaluating programs at the school, school system, and/or state level
- informing stakeholders, including students, teachers, school administrators, school system administrators, LDOE staff members, parents, and the public, of the status of students' progress toward meeting college and career readiness standards

This technical report refers to the uses of the test-level scores (i.e., scale scores and achievement levels), category-level scores and achievement-level classifications, and subcategory-level scores and achievementlevel classifications.

### 2.2 Test-Level Scores

At the test level, an overall scale score that is based on student performance on the entire test is reported. In addition, an associated level of achievement is reported. These scores and achievement levels indicate, in varying ways, a student's achievement in ELA or mathematics. Test-level scores are reported at four reporting levels: the state, the school system, the school, and the student.

The LEAP 2025 high school ELA and mathematics test forms were developed by DRC's test development staff using New Meridian's item bank as well as items from the Louisiana Department of Education's own item bank. Items taken from these banks were on pre-established item response theory (IRT) scales for ELA and mathematics and were reviewed and approved for use by LDOE content experts and committees of Louisiana educators. Braille forms and Spanish translations of mathematics forms were also developed. See Chapter 3, "Test Content Development," for additional details about the processes used to develop these test forms.

The following sections discuss two types of test-level scores that are reported that indicate a student's achievement on the LEAP 2025 assessments: the scale score and its associated level of achievement.

### 2.3 Scale Scores

A scale score indicates a student's total performance for each content area on the LEAP 2025 assessments. The overall scale score for a content area quantifies the achievement being measured by the ELA or mathematics assessments. In other words, the scale score represents the student's level of achievement, where higher scale scores indicate higher levels of achievement on the test and lower scale scores indicate lower levels of achievement. For all LEAP 2025 test forms, the lowest obtainable scale score (LOSS) is 650 and the highest obtainable scale score (HOSS) is 850.

Scale scores are derived from raw scores (i.e., the number of items answered correctly). Raw scores depend on the items in a particular form of a test and can only be interpreted in terms of that particular set of test questions. This does not allow year-to-year or form-to-form comparison. Scale scores are more meaningful than raw scores because they maintain their meaning year-to-year, thus allowing comparisons of different test forms across the entire range of the ability scale.

### 2.4 Levels of Achievement

A student's performance on the ELA or mathematics LEAP 2025 assessments is reported in one of five levels of achievement: Advanced, Mastery, Basic, Approaching Basic, or Unsatisfactory. The cut scores for the ELA and mathematics achievement levels were established by PARCC using the Evidence-Based Standard Setting (EBSS) method (Beimers, Way, McClarty, \& Miles, 2012) for the PARCC Performance-Level Setting (PLS) process. Details regarding the PLS process can be found in the Performance Level Setting Technical Report (Pearson, 2015).

Descriptions of each level of achievement in terms of what a student should know and be able to do are provided with the LEAP 2025 Interpretive Guide (see Chapter 7).

### 2.5 Use of Test-Level Scores

The LEAP 2025 scale scores and achievement levels provide summary evidence of student performance in ELA or mathematics relative to the Louisiana Student Standards. Classroom teachers may use these scores as evidence of student achievement in these content areas. At the aggregate level, school system and school administrators may use this information for activities such as curriculum planning. The results presented in this technical report provide evidence that the scale scores and achievement levels are valid and reliable indicators of what students know, understand, and are able to do relative to the Louisiana Student Standards in ELA and mathematics.

### 2.6 Category- and Subcategory-Level Subscores

A student's performance on the ELA categories (i.e., reading and writing) is reported by one of three ratings: Strong, Moderate, or Weak. Additionally, performance on the subcategories is reported at the student level for ELA and mathematics. ELA has three subcategories for reading and two subcategories for writing, as described in Table 3.1, ELA Categories and Subcategories. Mathematics has four reporting categories: Major Content, Additional \& Supporting Content, Expressing Mathematical Reasoning, or Modeling \& Application., as described in Table 3.8, Overview of LEAP 2025 Mathematics Task Types and Reporting Categories. Reporting categories are further broken down into subcategories, which vary by grade level. Subcategory performance is reported in one of three ratings: Strong, Moderate, or Weak.

Although the performance ratings are determined only by the items included within a category or subcategory, the level of knowledge and ability needed to demonstrate a performance rating is connected to the level of knowledge and ability required by the content-level assessments; a Strong rating requires similar knowledge and ability as the Mastery or Advanced achievement levels, a Moderate rating requires similar
knowledge and ability as the Basic achievement level, and a Weak rating requires similar knowledge and ability as the Unsatisfactory and Approaching Basic achievement levels.

### 2.7 Use of the Reporting Category- and Subcategory-Level Ratings

The purpose of reporting category- or subcategory-level performance ratings on LEAP 2025 assessments is to show, for each student, the relationship between the overall achievement being measured and the skills in each of the areas defined by the categories and subcategories. Teachers may use these ratings for individual students as indicators of strengths and weaknesses, but they are best corroborated by other evidence, such as grades, teacher feedback, and scores on other tests. Chapter 3 of this technical report provides evidence of content validity that supports the use of the category- or subcategory-level performance ratings. Chapter 9 of this technical report provides evidence of construct-related validity that further supports the use of these performance ratings.

## Chapter 3: Test Content Development

Content-related validity in achievement tests is evidenced by a correspondence between test content and the range of knowledge and skills that compose the construct the assessment is designed to measure, i.e., the ELA or mathematics Louisiana Student Standards. Content-related validity can be demonstrated through consistent adherence to test blueprints, through a high-quality test development process that includes review of items for accessibility to English learners and students with disabilities, and through alignment studies performed by independent groups. This chapter provides a detailed discussion of the test development process. In particular, it shows how rigorous procedures were followed to construct tests that reflect the full range of content that the 2019 LEAP 2025 assessments were expected to cover.

This chapter is particularly relevant to the following sections of the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014): Standards 4.0, 4.1, and 4.7. It also addresses Standards 3.1, 3.2, 3.9, and 4.12, which are discussed in pertinent sections of this chapter.

Standard 4.0 states the following:
Tests and testing programs should be designed and developed in a way that supports the validity of interpretations of the test scores for their intended uses. Test developers and publishers should document steps taken during the design and development process to provide evidence of fairness, reliability, and validity for intended uses for individuals in the intended examinee population (85).

Standard 4.1 states the following:

Test specifications should describe the purpose(s) of the test, the definition of the construct or domain measured, the intended examinee population, and interpretations for intended uses. The specifications should include a rationale supporting the interpretations and uses of test results for the intended purpose(s) (85).

The 2021 LEAP 2025 test specifications consisted of a test blueprint and a test design for each grade and content area. The 2021 blueprints and test designs were closely aligned to blueprints of New Meridian's full forms. The specific content area and grade-level test blueprints for the 2021 LEAP 2025 ELA assessments for grades 3-8 were designed with the goal for all students to read, understand, and express understanding of complex, grade-level texts. The specific content area and grade-level test blueprints for the 2021 LEAP 2025 mathematics assessments for grades 3-8 were designed with the goal of supporting students to become mathematically proficient by focusing on three components of rigor: conceptual understanding, procedural skill and fluency, and application. The 2021 LEAP 2025 ELA and mathematics assessments for grades 3-8 provide questions that have been reviewed by Louisiana educators to ensure their alignment to the Louisiana Student Standards and appropriateness for Louisiana students, measure the full range of student performance, and inform educators and parents about student readiness in ELA and mathematics and whether students are "on track" for college and careers. For ELA and mathematics, the 2021 LEAP 2025 assessments for grades 3-8 use the same reporting categories that were used in spring 2019. Subcategories in mathematics were introduced for spring 2018 in response to requests from school systems. In ELA, the type and/or number of reading literary and informational passage sets changed from the 2017 LEAP 2025 assessments to the 2018 LEAP 2025 ELA assessments to reflect a similar change made in the PARCC blueprints. This change was continued for the 2021 LEAP 2025 ELA assessments.

To construct the assessments after the test blueprints and test designs were approved, the LDOE and DRC collaborated to use items, aligned to the Louisiana Student Standards, from the New Meridian and Louisiana-

Copyright © 2022 by Louisiana Department of Education.
owned item banks. DRC contracted with New Meridian and was provided access to the entire bank of items and passage sets that could potentially be used on operational forms. The acquired items and passages and the Louisiana-owned items and passage sets make up the available item pool for the 2021 LEAP 2025 forms construction. The LDOE and DRC confirmed that all items selected for use on the LEAP 2025 forms were appropriate for use on Louisiana assessments by convening committees of Louisiana educators who reviewed and approved items from the item banks prior to form selection.

The ELA and mathematics LEAP 2025 assessments for grades 3-8 were developed based on the requirements of "RFP \#678PUR-LEAP 2025 English Language Arts and Mathematics Assessment System" as follows:

The assessments shall be

- aligned to the ELA and mathematics Louisiana Student Standards;
- designed to be accessible for use by the widest possible range of students, including, but not limited to, students with disabilities and students with limited English proficiency [English Learners];
- constructed to yield valid and reliable test results;
- constructed to report student performance using achievement level policy definitions and reporting categories that are comparable to a significant number of other states and, for grades 3 through 8 assessments, to Louisiana's 2015-2018 assessments;
- constructed to use Louisiana's grades 3 through 8 ELA and mathematics assessments as the baseline scale ${ }^{1}$ to report test results for grades 3 through 8 students;
- developed to limit the amount of testing time required and to be in compliance with state law regarding testing time;
- developed and reviewed with Louisiana educators;
- non-computer adaptive;
- used in assessing students' readiness to successfully transition to postsecondary education and the workplace; and
- administered, scored, and reported through a separate administration contract in both paperand computer-based formats.

The products of the above requirements are dual-mode assessments-paper-based tests (PBTs) and computer-based tests (CBTs)-comprised of New Meridian and Louisiana-owned items aligned to the Louisiana Student Standards. Louisiana had access to the complete New Meridian item bank for forms administered in spring 2021. For grades 3 and 4, the contract with New Meridian provided for the use of enough tems and passage sets, which had been approved during Item Alignment Reviews, combined with additional items and passage sets developed specifically for Louisiana, to create one complete operational test form for each content area and grade that can be administered in a dual-mode testing environment (i.e., PBT and CBT). For grades 5-8, Louisiana selected one CBT form per grade from the content that was reviewed during Item Alignment Reviews in addition to items and passage sets developed specifically for Louisiana. These items and passage sets became the available item pool used to construct the 2021 forms. DRC and LDOE content experts scrutinized each final blueprint to ensure optimal content coverage and prudent use of time and resources. In general, the blueprints represent content sampling proportions that reflect intended emphasis in instruction and mastery at each grade level and are comparable to New

[^0]Meridian's test blueprints. The test specifications provide the numbers of items by reporting category, assessment focus, or item type, and they demonstrate the desired proportions within test delivery and available item pool constraints. These specifications can be found in the 2020-2021 LEAP 2025 Grades 3-8 English Language Arts and Mathematics Assessment Frameworks. All assessments were fixed forms, which means that all students who received the same form were administered the same set of items, as the forms were not adaptive.

### 3.1 Defining the Specific Test Blueprint

The specific content area and grade-level test blueprints were designed based on two primary factors: (1) the content requirements of the Louisiana Student Standards and (2) the reporting needs of the assessments.

### 3.2 English Language Arts Test Blueprints and Test Designs

The ELA test was administered during a CBT testing window (April 26-May 26, 2021) and during a PBT testing window (April 28-April 30, 2021). The 2021 ELA assessment was the same as the 2019 assessment with one exception. An item in grade 7 was edited from its previous use. Only two of the three types of performance tasks—Research Simulation Task, Literary Analysis Task, and Narrative Writing Task—were included on each of the Louisiana grade-level tests; however, all three types were represented across grades 3 through 8 . This allows Louisiana to rotate the tasks given for each grade from administration to administration and encourages educators to focus on all three performance task types. As the choice of Literary Analysis Task or Narrative Writing Task would be made during the forms construction process, alternative blueprints-one with a Literary Analysis Task and a Research Simulation Task and the other with a Research Simulation Task and a Narrative Writing Task-were created for each grade. During forms construction, the Narrative Writing Task was selected for grades 3, 6, and 7 and the Literary Analysis Task was selected for grades 4, 5, and 8, based on item performance and the quality of the available passage sets for each performance task.

Student performance on the LEAP 2025 ELA assessments is reported by category and subcategory as outlined in the following table.

Table 3.1 ELA Categories and Subcategories

| Category | Subcategory | Subcategory Description |
| :--- | :--- | :--- |
|  | Reading Literary Text | Reading Informational Text <br> fiction, drama, and poetry. |
|  | Writing | Students read and demonstrate comprehension of grade-level <br> nonfiction, including texts about history, science, art, and <br> music. |
|  | Reading Vocabulary | Students use context to determine the meaning of words and <br> phrases in grade-level texts. |
|  | Knowledge and Use of <br> Language Conventions | Students use details from provided texts to compose well- <br> developed, organized, clear writing. |
| Students use the rules of standard English (grammar, |  |  |
| mechanics, and usage) to compose writing. |  |  |

These reporting categories are the same as the reporting categories on the spring 2015-2018 ELA student reports and provide parents and educators with valuable information about

- overall student performance, including readiness to continue further study in English language arts;
- student performance broken down by subcategory which may help identify when students need additional support or more challenging work in reading and writing; and
- how well schools and school systems help students achieve expectations.

The session testing times shown in the ELA test blueprints (see Tables 3.2 through 3.6) are based on New Meridian testing times proportioned to be comparable based on the passage type being tested. The passage set that comes after the Narrative Writing Task is designed to balance the reading load between the Literary Analysis Task and the Narrative Writing Task. It is also designed to provide consistent timing in sessions 1 and 2.

*Reading vocabulary items must constitute at least eight points on the test.
**The time in session 3 allows for an additional passage set that is being field tested.

The LEAP 2025 ELA assessments consist of tasks and reading passage sets. The tasks are described below.

- Narrative Writing Task
- This task asks students to read a literary text, answer a set of selected-response questions about the text, and create a narrative related to the text (e.g., finish the story, retell the story in another narrative form or from a different point of view).
- This task focuses on students' ability to use narrative elements (e.g., dialogue, description) when writing.
- Literary Analysis Task
- This task provides students with an opportunity to show their understanding of literature. It asks students to read two literary texts, answer a set of selected-response questions about the texts, and write an extended response that compares and/or explains key ideas or elements in the texts (e.g., central idea/message, contribution of illustrations, characterization).
- This task focuses on students' ability to read complex text closely and asks them to carefully consider literature worthy of close study.
- Research Simulation Task
- This task mirrors the research process by presenting three texts on a given topic. Students answer a set of selected-response questions about the texts and then write an extended response about some aspect of the related texts (e.g., relationship between a series of events, ideas, or concepts; comparison/contrast of key details; presentation of information).
- This task requires students to synthesize information from related informational resources.

The following item types were included in the 2019 LEAP 2025 ELA assessments:

- Selected-Response Items:
- Evidence-based selected response (EBSR): This item type consists of two parts. One part asks students to show their understanding of a text, and the other part asks students to identify evidence to support that understanding. The evidence supports a generalization, conclusion, or inference. This type of item is designed to provide students with opportunities to make explicit the evidence that supports their close analysis of a specific text.
- Multiple select (MS): This item type requires students to select more than one correct answer and may appear as a one-part question or as part of an EBSR item. This type of item allows for the assessment of students' ability to identify multiple pieces of evidence to support a claim.
- Technology enhanced (TE): This item type allows measurement of learning that may not be sufficiently measured by traditional multiple-choice items. TE items can measure the ordering of ideas within a summary; ordering of steps in a process; sorting, classifying, and categorizing ideas; matching of two themes/ideas to their unique evidence, etc. The technology used in TE items offers students additional ways to show understanding that parallels the classroom instructional techniques that teachers use to determine whether students are able to comprehend complex, grade-level text. TE Items may involve any of the following:
- Highlighting text: requires students to select text-based answer(s) from within a larger text
- Drag and drop: requires students to move draggable elements (e.g., words, phrases, or sentences) into one or more drop boxes (e.g., cells within a table or part[s] of a diagram)
- Drop-down menu: requires students to select from one or more drop-down menus to complete a phrase or sentence
- Match interaction table: requires students to select a checkbox in each row from two or more columns to classify statements presented in each row
- Prose constructed response (PCR): This item type appears at the end of each task and asks students to create an extended, complete written response. It elicits evidence that students have understood a text or texts they have read and can communicate that understanding well, both in terms of written expression and in terms of knowledge and use of language conventions.

A variety of item types allows for the measurement of the full range of student performance. Items and tasks should be clearly aligned to specific standards. Some items and tasks may ask students to draw evidence from one specific standard, while others may ask students to draw evidence from several standards.

The following table details the number of items and points by session and item type for each of the PBT (grades 3 and 4) and CBT (grades 3-8) forms.

Table 3.7 Distribution of ELA Items and Points by Session and Item Type

|  | Sub | Gr | Session | EBSR |  | MS |  | TE |  | PCR |  | Total <br> No. of Pts. |

### 3.3 Mathematics Test Blueprints and Test Designs

The mathematics assessments were administered during a CBT testing window (April 26-May 26, 2021) or during a PBT testing window (April 28-April 30, 2021). The 2021 mathematics assessment was the same as the 2019 assessment, with the following exceptions: grade 3 had one item replaced and grades $3,4,5,6$, and 8 had some items changed from operational status to field test/placeholder stature. Each test session included the four mathematics categories, using the three mathematics task types (see Table 3.8).

Each item on the LEAP 2025 mathematics assessment is referred to as a task and is identified by one of three types: Type I, Type II, and Type III. As shown in the following table, each task type is aligned to one or two of four reporting categories: Major Content, Additional \& Supporting Content, Expressing Mathematical Reasoning, or Modeling \& Application. Each task type is designed to align with at least one of the Standards for Mathematical Practice (MP).

Table 3.8 Overview of LEAP 2025 Mathematics Task Types and Reporting Categories

| Task <br> Type | Description | Reporting Categories | Mathematical Practice(s) |
| :--- | :--- | :--- | :--- |
| Type I | Conceptual understanding, <br> fluency, and application | Major Content: solve problems <br> involving the major content for <br> the grade level. <br> Additional \& Supporting <br> Content: solve problems <br> involving the additional and <br> supporting content for the grade | Can involve any or all practices |
| Type II | justifications, critique of <br> reasoning, or precision in <br> mathematical statements | Expressing Mathematical <br> Reasoning: express <br> mathematical reasoning by <br> constructing mathematical <br> arguments and critiques. | Primarily MP.3 and MP.6 but <br> may also involve any of the <br> other practices |
| Type III | Modeling/application in a real- <br> world context or scenario | Modeling \& Application: solve <br> real-world problems engaging <br> particularly in the modeling <br> practice. | Primarily MP.4 but may also <br> involve any of the other <br> practices |

These reporting categories provide parents and educators with valuable information about

- overall student performance, including readiness to continue further study in mathematics;
- student performance broken down by mathematics subcategory, which may help identify when students need additional support or more challenging work; and
- how well schools and school systems help students achieve higher expectations.

Table 3.9 provides the distribution of operational points by reporting category, by grade.
Table 3.9 Distribution of Points by Reporting Category-Mathematics

|  | Grade |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Reporting Category | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |
| Major Content | 30 | 30 | 30 | 30 | 30 | 30 |
| Additional \& Supporting Content | 10 | 10 | 10 | 10 | 10 | 10 |
| Expressing Mathematical Reasoning | 10 | 10 | 10 | 14 | 14 | 14 |
| Modeling \& Application | 12 | 12 | 12 | 12 | 12 | 12 |
| Total | $\mathbf{6 2}$ | $\mathbf{6 2}$ | $\mathbf{6 2}$ | $\mathbf{6 6}$ | $\mathbf{6 6}$ | $\mathbf{6 6}$ |

The Major Content areas for mathematics are broken into subcategories by grade as follows:
Table 3.10 Major Content Subcategories by Grade

| Grade | Major Content Subcategory |
| :---: | :---: |
| 3 | - Products and Quotients/Solve Multiplication and Division Problems <br> - Solve Problems with Any Operation <br> - Fractions as Numbers and Equivalence <br> - Solve Time, Area, Measurement, and Estimation Problems |
| 4 | - Compare and Solve Problems with Fractions <br> - Solve Multi-step Problems <br> - Multiplicative Comparison and Place Value |
| 5 | - Operations with Decimals/Read, Write, and Compare Decimals <br> - Solve Fraction Problems <br> - Interpret Fractions, Place Value, and Scaling <br> - Recognize, Represent, and Determine Volume/Multiply and Divide Whole Numbers |
| 6 | - Rational Numbers/Multiply and Divide Fractions <br> - Ratio and Rate <br> - Expressions, Inequalities, and Equations |
| 7 | - Analyze Proportional Relationships and Solve Problems <br> - Operations with Rational Numbers <br> - Expressions, Inequalities, and Equations |
| 8 | - Radicals, Integer Exponents, and Scientific Notation <br> - Proportional Relationships, Linear Equations, and Functions <br> - Solving Linear Equations/Systems of Linear Equations <br> - Congruence and Similarity/Pythagorean Theorem |

The resulting 2019 LEAP 2025 mathematics test blueprints are shown in Tables 3.11-3.16.

Unlike the ELA test blueprints, which were organized by test sessions one through three, the mathematics test blueprints were organized by reporting categories, so it was necessary to define the general structure of the test forms by test session. The design goal was to have balanced test sessions with a variety of task types and equivalent testing times. For all forms in grades 3-5, students were prohibited from using calculators, except for those students with a documented calculator accommodation. For session one of the mathematics test in grades 6-8, students are prohibited from using calculators, except those students with a documented calculator accommodation. Calculators were allowed to be used by all students in grades 6-8 in sessions two and three. The general test structures (see Tables 3.17-3.22) guided test form sequencing and design. The LEAP 2025 Calculator Policy provided the basis for calculator designation of tasks and items.

*The testing time includes items that are being field tested.

The following item types were used in the 2021 LEAP 2025 mathematics assessments:

- Multiple choice: This item type requires students to select one correct answer from four answer choices. It may appear as a one-part question, as part of a two-part question, or as a part of a constructed-response item. The multiple choice items are worth one point.
- Multiple select: This item type requires students to select more than one correct answer from more than four answer choices. It may appear as a one-part question, as part of a two-part question, or as a part of a constructed-response item. The multiple select items are worth one point. Students must choose all correct answers and no incorrect answer to receive credit.
- Short answer: This item type requires students to enter a numeric response by typing from the keyboard; it allows a decimal and numbers for grades 3-8 and a negative sign for grades 6-8. It may appear as a one-part question, as part of a two-part question, or as a part of a constructedresponse item. The short answer items are worth one point. Unless specified in the question, a student will earn credit for an answer that is equivalent to the correct numerical answer and proper rounding may be required.
- Keypad input: This item type requires students to enter a mathematical response using a customized pallet of numbers, operations, variables, and/or mathematical symbols; allows all rational and irrational numbers as well as expressions and equations; and scores all equivalent responses as correct unless noted otherwise. This item type may appear as a one-part question, as part of a two-part question, or as a part of a constructed-response item
- Constructed response: This item type requires students to respond to an open-ended question which must be typed into a response box; students may use the equation builder tool (specific to the grade or grade span) to insert mathematical characters. This item type can be a single- or multi-part item. Constructed-response items ask students to write explanations or justifications, model a process, and/or solve real-world, multi-step contextual problems. A student may receive partial or full credit on constructed-response items, and maximum point values will vary by constructed-response task. Maximum values for constructed-response items are 3, 4, or 6 points.
- Technology enhanced: This item type uses technology to capture student responses.

Technology-enhanced items may appear as a one-part question, as part of a two-part question, or as a part of a constructed-response item. The technology-enhanced items are worth one point. Technology-enhanced items may involve any of the following:

- Bar graph: requires students to complete a bar graph or histogram by raising/lowering each bar to a value
- Drag and drop: requires students to move draggable elements into one or more drop boxes
- Dropdown menu: requires students to select from one or more dropdown menus to complete a sentence, phrase, or expression/equation/inequality
- Hot spot: requires students to select one or more responses by choosing selectable areas on the screen
- Match interaction table: requires students to select a checkbox in each row from two or more columns
- Graph input: requires students to enter a response on a coordinate grid
- Number line input: requires a student to enter a response on a number line
- Line plot: requires students to complete a line plot with " $X$ " as the input

A variety of item types allows for the measurement of the full range of student performance.

The following table details the number of items by point value and task type as well as the number of points per task type for each of the PBT (grades 3 and 4) and CBT (grades 3-8) forms.

Table 3.23 Distribution of Mathematics Tasks and Points by Task Type

|  | Content Area | Grade | Type I |  |  | Type II |  |  | Type III |  |  | Total Points |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $1 \text { pt }$ Tasks | $\begin{aligned} & \text { 2 pt } \\ & \text { Tasks } \end{aligned}$ | Points | $\begin{aligned} & \text { 3 pt } \\ & \text { Tasks } \end{aligned}$ | 4 pt Tasks | Points | 3 pt <br> Tasks | 6 pt <br> Tasks | Points |  |
|  | Math | 3 | 34 | 3 | 40 | 2 | 1 | 10 | 2 | 1 | 12 | 62 |
| $\frac{\bar{\partial}}{\stackrel{0}{0}}$ | Math | 4 | 34 | 3 | 40 | 2 | 1 | 10 | 2 | 1 | 12 | 62 |
|  | Math | 3 | 34 | 3 | 40 | 2 | 1 | 10 | 2 | 1 | 12 | 62 |

|  | Math | 8 | 30 | 5 | 40 | 2 | 2 | 14 | 2 | 1 | 12 | 66 |

### 3.4 Item Development and Selection

The processes of item development and selection are discussed in this section in compliance with the Standards.

Standard 4.7 states the following:
The procedures used to develop, review, and try out items and to select items from the item pool should be documented (87).

The items used in the 2021 LEAP 2025 ELA and mathematics assessments came from New Meridian's and Louisiana-owned item banks.

The items selected for use on the 2021 LEAP forms were used to equate to the LEAP 2025 scale. Operational forms were selected based on LEAP 2025 test blueprint specifications, which were supported by statistical data from New Meridian operational testing.

### 3.5 Considerations of Test Fairness in Item Development

Standard 3.2 is particularly relevant to fairness in item development:
Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics (64).

Bias and sensitivity guidelines used to develop the New Meridian and Louisiana-owned items help ensure the assessments are fair for all groups of test takers, despite differences in characteristics that include, but are not limited to, disability status, ethnic group, race, gender, regional background, native language, religion, sexual orientation, and socioeconomic status. DRC relied strongly on the bias and sensitivity guidelines in the development of the assessments, particularly in item selection and review. To be included in the assessments, items had to comply with the bias and sensitivity guidelines and be approved by Louisiana educators involved in the Louisiana alignment and item review meetings.

### 3.6 New Meridian Item Reviews

As part of New Meridian's ongoing item development practices, several educator committees had already been convened to conduct rigorous reviews of every passage and item developed for the New Meridian assessment system prior to the items becoming a part of the item bank that included items and passages available for selection on Louisiana forms. These reviews include

- text reviews of all passages (during which participants review and edit passages independently and then discuss content and bias concerns as a grade-level group),
- item reviews (during which committees review and edit items for adherence to PARCC foundational documents, basic principles of universal design, accessibility guidelines, selected metadata fields, and a style guide),
- bias and sensitivity reviews (during which educators and community members review items and tasks to confirm the absence of issues relating to bias, fairness, and sensitivity to ensure that items and tasks do not unfairly advantage or disadvantage any student subgroup over another subgroup),
- editorial reviews (during which the review committee completes a copy edit review and records member comments), and
- data reviews (during which educators evaluate item-level statistics to determine eligibility of items and tasks to move forward to the operational assessments).

Additional information on New Meridian's item review processes and procedures can be found at the New Meridian Resource Center. Only items that have been approved by expert reviewers during text reviews (ELA only), item reviews, bias and sensitivity reviews, and editorial reviews are moved forward for field testing. Of the field tested items, only those determined to have acceptable statistics, either by having acceptable item parameters according to the data review flagging criteria or by being approved by expert reviewers during data review, are eligible for review by Louisiana educators for potential use on an operational assessment. These processes follow the criteria set forth by the Standards.

Standard 3.1 states the following:
Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population (63).

Standard 3.2 states the following:
Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests' being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics (64).

Independent studies of New Meridian passages and items have found that the content being licensed assesses the skills that matter most and is rigorous, aligned to standards, and accessible to students with disabilities and English learners. For more information on the studies performed, refer to New Meridian's website: https://resources.newmeridiancorp.org/research/.

### 3.7 Operational Test Selection

The operational test administered in the 2021 spring administration were the same forms used in the 2019 spring administration, with the following exceptions. In grade 3 math, one item was replaced with an operational item from 2018 that aligned to the same sublcaim and had the same score point. In grade 7 ELA, one item was edited from its previous use. For information regarding item and form seletion, please refer to the 2019 LEAP 2025 Grades 3-8 Operational Technical Report: English Language Arts and Mathematics. The LEAP 2025 assessments were given in two modalities: computer-based test (CBT) or paper-based test (PBT). For both ELA and mathematics, students in grades 3 through 8 took the CBTs; some school systems elected to administer the PBTs to students in grades 3 and 4. For ELA, the dual-mode forms were identical except for a small quantity (four to five items) of technology-enhanced items (TE) in each CBT. Items used on PBTs as replacements for the TE items were evidence-based selected-response items that addressed the same content standards and were of similar rigor as the TE items, when possible. For mathematics, short-answer (SA) items were reformatted as gridded-response (GR) items for use on PBTs.

### 3.8 Universal Design

Grade-level assessments that follow universal design guidelines allow participation of the widest possible range of students, resulting in more valid inferences about students' performances. Such assessments may reduce the need for accommodations by reducing or eliminating access barriers associated with the tests themselves. Table 3.25 presents the elements of universal design (Thompson \& Thurlow, 2002). The elements of universal design are relevant to both item development and form construction. This section describes how the elements of universal design were addressed in the construction of the test forms administered in 2021 in compliance with AERA, APA, \& NCME (2014) Standard 3.1, which states the following:

Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population (63).

Universal design requires that grade-level assessments measure the performance of students with a wide range of abilities and skills, ensuring that students with diverse learning needs receive opportunities to demonstrate competence on the same content. To ensure that students can access the tests, the LEAP 2025 assessments include simple, clear, and intuitive instructions and procedures; maximum readability and comprehensibility; and maximum legibility. The online test specifications define how directions and test items are formatted online, including the spacing between an item stem and answer choices, and other page elements (such as online tools and Help files) to ensure consistent, clean visual appearance of CBTs. Test directions at the beginning of each test session were clearly and simply stated, and the wording of such instructions is standardized as much as possible across content areas and grade levels to ensure clarity and consistency while being comparable to the requirements followed by PARCC and New Meridian.

Table 3.24 Elements of Universal Design

| Element | Explanation |
| :--- | :--- |
| Inclusive Assessment <br> Population | Tests designed for state, school system, or school accountability must <br> include every student except those in the alternate assessment, and <br> this is reflected in assessment design and field testing procedures. |
| Precisely Defined <br> Constructs | The specific constructs tested must be clearly defined so that all <br> construct-irrelevant cognitive, sensory, emotional, and physical <br> barriers can be removed. |
| Accessible, Non-Biased <br> Items | Accessibility is built into items from the beginning, and bias review <br> procedures ensure that quality is retained in all items. |
| Amenable to <br> Accommodations | The test design facilitates the use of needed accommodations (e.g., all <br> items can be in braille form). |
| Simple, Clear, and Intuitive <br> Instructions and Procedures | All instructions and procedures are simple, clear, and presented in <br> understandable language. |
| Maximum Readability and <br> Comprehensibility | A variety of readability and plain language guidelines are followed <br> (e.g., sentence length and number of difficult words are kept to a <br> minimum) to produce readable and comprehensible text. |
| Maximum Legibility | Characteristics that ensure easy decipherability are applied to text, <br> tables, figures, illustrations, and response formats. |

### 3.9 Accommodations and Designated Supports

AERA, APA, \& NCME (2014) Standard 3.9 states the following:
Test developers and/or test users are responsible for developing and providing test accommodations, when appropriate and feasible, to remove construct-irrelevant barriers that otherwise would interfere with examinees' ability to demonstrate their standing on the target constructs (67).

Students with IEPs, 504 plans, and English learners (ELs) may be provided test administration accommodations as documented on their accommodation plan. More information on accommodations can be found in Section 4.3.2 of Chapter 4. Accommodation code definitions can be found in the Paper-Based Test Administration Manual.

Accommodated print forms were developed in grades 5-8 of ELA and mathematics for those students who were unable to participate in an online administration. For a detailed description of the process used to develop the accommodated print forms and how to modify technology-enhanced items for use in an accommodated print form, see Appendix A, Accommodated Print Form Creation.

Braille and large-print test forms were constructed for each grade and content area to enable students with visual impairments to participate in the LEAP 2025 assessments. Braille and large-print forms for grades 3 and 4 of ELA and mathematics were based on the standard-print forms. Braille forms for grades 5-8 of ELA and mathematics were based on the accommodated print forms. There are no large-print versions of the grades 5-8 accommodated print forms. Instead, students needing a large-print version in grades 5-8 use larger-sized monitors and/or the magnification features of the online testing system. All online test content has been developed to scale in relation to the available area on larger monitors while maintaining the correct aspect ratio. Specific recommendations on how to transcribe items into braille were provided by the braille
publisher to produce the braille version of the LEAP 2025 assessments and the test administrator's notes that accompany the braille forms. The goal was to maximize the number of items on the braille forms that could be transcribed into braille.

The following assessment features were available to all students and do not require any documentation either prior to or during the assessment:

- blank scratch paper and graph paper
- calculators (to be used in the calculator section only)
- color overlay
- contrasting colors/reverse colors
- directions in native language
- equation builder
- bookmark
- general administration directions clarified
- general administration directions read aloud and repeated as necessary
- general masking
- headphones
- highlighters
- line guides
- magnifiers/variable zoom
- measurement tools
- redirection of student to the test
- specialized furniture or equipment
- sticky note/notepad
- strikethrough
- and writing/formatting tools (for ELA constructed response items only).

Accessibility features were available for all students with the particular need documented in their Individualized Education Programs (IEPs), Individual Accommodation Plans (IAPs), English Learner (EL) plans, or Personal Needs Profiles (PNPs). The following accessibility features were available: individual testing, small group testing, student reads assessment aloud to himself or herself, adaptive and specialized equipment or furniture, and math read aloud (text-to-speech or human reader).

Accommodations were available for students who have an IEP, IAP, or EL plan, including: braille test materials, calculation device and math tools for non-calculator sections of mathematics assessments, transferred answers, recorded answers, large print test materials (mathematics Spanish), mathematics Spanish read aloud, translated mathematics test, test read aloud (text-to-speech, Kurzweil, recorded audio file). For details on how these assessment and accessibility features and accommodations should be used with PBTs and CBTs, see the LEAP 2025 Accommodations and Accessibility Features User Guide.

For a detailed description of the process used to develop the Spanish translation forms of the mathematics tests, see Appendix B, "Forms Development Process for Spanish Translations Forms."

### 3.10 Item and Task Specifications

AERA, APA, \& NCME (2014) Standard 4.12 states the following:
Test developers should document the extent to which the content domain of a test represents the domain defined in the test specifications (89).

The item and task specifications are designed to ensure that the assessment items measure the assessment's claims. The purpose of the item and task specifications is to define the characteristics of the items and tasks that will provide the evidence to support one or more claims. To do this, the item and task specifications delineate the types of evidence, or targets, that should be elicited for each reporting category within a grade level. Then, the specifications provide explicit guidance on how to write items to elicit the desired evidence.

The item and task specifications provide guidance on how to measure the targets (i.e., standards) first found in the content specifications and guidelines on how to create the items that are specific to each assessment target and reporting category. In ELA and mathematics, item specifications describe the knowledge, skills, and processes being measured by each item type aligned to particular standards.

These item specifications were developed for each grade and standard to delineate the expectations of knowledge and skill to be included on test questions. In addition, the ELA and mathematics item and stimulus specifications provide guidance on determining the appropriateness of task and stimulus materials (i.e., the materials that a student must refer to when working on a test question). The stimulus specifications also provide information on the characteristics of stimuli or activities that should be avoided because they are not important to the knowledge, skill, or process being measured. This underscores DRC's efforts to select items that are accessible to the widest range of students possible; in other words, 2021 LEAP 2025 items were selected according to the elements of universal design.

### 3.11 Summary

In summary, the overall purpose of this chapter is to explicate the procedures used in the development of the forms administered during the spring 2021 LEAP 2025 administation. . The efforts by the LDOE and DRC in developing the LEAP 2025 assessments are in alignment with multiple best practices of the test industry but, in particular, support the following AERA, APA, \& NCME (2014) standards:

Standard 3.1 Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population (63).

Standard 3.2 Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics (64).

Standard 3.9 Test developers and/or test users are responsible for developing and providing test accommodations, when appropriate and feasible, to remove construct-irrelevant barriers that otherwise would interfere with examinees' ability to demonstrate their standing on the target constructs (67).

Standard 4.0 Tests and testing programs should be designed and developed in a way that supports the validity of interpretations of the test scores for their intended uses. Test developers and publishers should document steps taken during the design and development process to provide evidence of fairness, reliability, and validity for intended uses for individuals in the intended examinee population (85).

Standard 4.1 Test specifications should describe the purpose(s) of the test, the definition of the construct or domain measured, the intended examinee population, and interpretations for intended uses. The specifications should include a rationale supporting the interpretations and uses of test results for the intended purpose(s) (85).

Standard 4.7 The procedures used to develop, review, and try out items and to select items from the item pool should be documented (87).

Standard 4.12 Test developers should document the extent to which the content domain of a test represents the domain defined in the test specifications (89).

## Chapter 4: Test Administration

Chapter 4 of the technical report describes the processes implemented and the information disseminated to help ensure standardized test administration procedures and, thus, uniform test administration conditions for students. According to the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014), "The usefulness and interpretability of test scores require that a test be administered and scored according to the test developer's instructions" (111). This chapter examines how test administration procedures implemented for the 2021 Louisiana Education Assessment Program (LEAP 2025) strengthen and support the intended score interpretations and reduce construct-irrelevant variance that could threaten the validity of score interpretations.

Chapter 4 demonstrates how the LEAP 2025 assessments adhere to AERA, APA, \& NCME (2014) Standards $4.15,6.1,6.2,6.3,6.4,6.6$, and 6.7. Each standard will be explicated within the relevant section of this chapter.

To ensure that the LEAP 2025 assessments are administered in accordance with the department's mandates, the LDOE takes a primary role in communicating with and training school system personnel. The development of the assessments is a collaborative effort between the LDOE and DRC. The LDOE conveys to school systems the purpose of the assessments and the importance of test administration being consistent with test industry standards. The tests and administration standards must also meet the State Board of Elementary and Secondary Education policies and the mandates of both state and federal legislation.

To accomplish these goals, the LDOE provides train-the-trainer opportunities for school system test coordinators, who, in turn, administer test-administration training to schools within their school systems. The LDOE conducts quality assurance visits during testing to ensure that school systems adhere to the standardized administration of the tests.

The district test coordinators are responsible for the schools within their school systems. They disseminate information to each school, offer assistance with test administration, and serve as liaisons between the LDOE and their school systems. The LDOE also provides assistance with and interpretation of assessment data and test results.

Ancillary materials for the LEAP 2025 test administration contribute to the body of evidence of the validity of score interpretation. This section examines how the test materials address the standards related to test administration procedures.

For the spring 2021 administration of the LEAP 2025 assessments, DRC produced the following administration manuals: LEAP 2025 Grades 3-4 Paper-Based Test Administration Manual and LEAP 2025 Grades 3-8 Computer-Based Test Administration Manual (TAMs). DRC also produced the following Test Coordinator Manuals: LEAP 2025 Computer-Based Test Coordinator Manual and LEAP 2025 Paper-Based Test Coordinator Manual (TCMs). LDOE assessment administration and development staff review these manuals, provide feedback, and give final approval. The TCMs include ELA, mathematics, social studies, and science in grades 3 through 8. They provide detailed instructions for district and school test coordinators' on distributing and collecting test materials and for returning them to DRC.

Paper-Based Administration Test Coordinator Manual Table of Contents

1. Key Dates
2. Alerts
3. Oath of Security and Confidentiality Statements
4. General Information
5. LEAP 2025

The TAMs are specific to grades, content areas, and modes of administration (i.e., online or paper). They provide detailed instructions for administering the LEAP 2025 assessments. The manuals include instructions for test security, test administrator responsibilities, test preparation, administration of tests (i.e., online or paper), and post-test procedures. Information included in the TAMs is listed below.

1. Spring Notes and Reminders
2. Test Administrator Oath of Security and Confidentiality Statements
3. Overview
4. Test Security
4.1. Secure Test Materials
4.2. Testing Irregularities and Security Breaches

20. Index

The Standards contain multiple references that are relevant to test administration. Information in the TAMs addresses these standards.

The directions for test administration found in the manual address Standard 4.15, which states:
The directions for test administration should be presented with sufficient clarity so that it is possible for others to replicate the administration conditions under which the data on reliability, validity, and (where appropriate) norms were obtained. Allowable variations in administration procedures should be clearly described. The process for reviewing requests for additional testing variations should also be documented (90).

The LEAP 2025 Test Administration Manuals provide instructions for activities conducted before, during, and after testing with sufficient detail and clarity to support reliable test administrations by qualified test administrators. To ensure uniform administration conditions throughout the state, instructions in the manuals describe the following: general rules of paper and online testing; assessment duration, timing, and sequencing information; and the materials required for testing.

Furthermore, the standardized procedures addressed in the test administration manual need to be followed, as the Standards state in Standard 6.1:

Test administrators should follow carefully the standardized procedures for administration and scoring specified by the test developer and any instructions from the test user (114).

It was essential that the LEAP 2025 was administered according to the prescribed test administration manual to ensure the usefulness and interpretability of test scores and to minimize sources of construct-irrelevant variance. It should be noted that adhering to the test schedule is also a critical component. The test administration manuals include instructions for scheduling the test within the state testing window. The test administration manual also contains the schedule for timing each test session. The test timing schedule is presented in Table 4.1.

Standard 6.3 Changes or disruptions to standardized test administration procedures or scoring should be documented and reported to the test user (115).

The LDOE test administration staff reports on testing concerns that describe a wide range of improper activities that may occur during testing, including the following: copying and reviewing test questions with students; cueing students during testing, verbally or with written materials on the classroom walls; cueing students nonverbally, such as by tapping or nodding the head; using a calculator on parts of the test where it is not allowed; allowing students to correct or complete answers after tests have been submitted; splitting sessions into two parts; ignoring the standardized directions in the online assessment; reading the ELA assessment to students with the exception of those students with the read-aloud accommodation; paraphrasing parts of the test to students; changing or completing (or allowing other school personnel to change or complete) student answers; allowing accommodations that are not written in the accommodation plan; allowing accommodations for students who do not have an accommodation plan; or defining terms on the test.

Standard 6.4 The testing environment should furnish reasonable comfort with minimal distractions to avoid construct-irrelevant variance (116).

Test administration manuals outline the steps that teachers should take to prepare classroom environment testing for administering the LEAP 2025 assessments. These steps include the following:

- Determine the layout of the classroom environment.
- Plan seating arrangements. Allow enough space between students to prevent the sharing of answers.
- Eliminate distractions such as bells or telephones.
- Use a Do Not Disturb sign on the door of the testing room.
- Make sure classroom maps, charts, and any other materials that relate to the content and processes of the test are covered, removed, or out of the students' view.

Standard 6.6 Reasonable efforts should be made to ensure the integrity of test scores by eliminating opportunities for test takers to attain scores by fraudulent or deceptive means (116).

The test administration manuals present instructions for post-test activities to ensure that online tests are submitted and printed test materials are handled properly to maintain the integrity of student information and test scores. Detailed instructions guide test examiners in submitting all online test records. For students who were administered a large-print or braille test form, examiners are instructed to transcribe students' responses from the large-print test or braille test form into a consumable test booklet for grades 3 and 4, and the online testing system (INSIGHT) for grades 5 through 8 , exactly as the responses appear in the original form.

Standard 6.7 Test users have the responsibility of protecting the security of test materials at all times (117).

Throughout the manuals, test coordinators and examiners are reminded of test security requirements and procedures to maintain test security. Specific actions that are direct violations of test security are so noted. Detailed information about test security procedures are presented under "Test Security" in the test administration manuals.

### 4.1 Return Material Forms and Guidelines

The Test Coordinator Manual instructs test coordinators on how to organize, pack, and return testing materials to DRC for secure inventory purposes. The LDOE assessment administration and development staff have opportunities to review these materials, provide feedback, and give final approval. The purpose of the instructions is to ensure the secure test materials are properly accounted for and organized appropriately for return shipment.

### 4.2 Security Checklists

As soon as printed test materials are received by a school system, the district test coordinator confirms the receipt and count of the school system materials and completes the Receipt Notice in eDIRECT to confirm all school system materials have been received. The district test coordinator then packages the tests to be sent to schools. Upon returning secure test materials to DRC, district test coordinators are required to complete and submit a materials accountability form that details the number of consumable test booklets or secure accommodated test materials returned. This materials accountability form also requires that school systems document nonstandard situations, including lost, damaged, destroyed, extra, or missing test books. This form ensures all materials are accounted for. Any material not accounted for on this form is place on a missing materials list which is used by DRC and the LDOE to follow up with all districts to ensure security of all materials. A sample accountability form is shown in Figure 4.1.

Figure 4.1 Sample Accountability Form

### 4.3 Interpretive Guides

An understanding of what test scores mean and how to interpret score reports is essential to making valid interpretations of the test scores. The Interpretive Guide is written for Louisiana teachers and administrators who receive the LEAP 2025 score reports. More details about the guide can be found in Chapter 7.

### 4.4 Test Security Measures

Maintaining the security of all test materials is crucial to preventing the possibility of random or systematic errors, such as unauthorized exposure of test items that would affect the valid interpretation of test scores. Several test security measures are implemented for the LEAP 2025 assessments. Test security procedures are discussed throughout the Test Coordinator Manuals and Test Administration Manuals.

Test coordinators and administrators are instructed to keep all test materials in locked storage, except during actual test administration, and access to secure materials must be restricted to authorized individuals only (e.g., test administrators and the school test coordinator). During testing sessions, the test administrators are directly responsible for the security of the LEAP 2025 assessments and must account for all test materials and supervise the test administration at all times.

### 4.5 Data Forensic Analyses

Due to the importance of the LEAP 2025 assessment, it is prudent to ensure that the results from the assessments are based on effective instruction and true student achievement. While there are many ways to achieve meaningful understanding of student knowledge via test scores, there are also ways to obtain higher test scores that are not related to actual learning. To assist ensuring that assessment results are valid, data forensic analyses are conducted to help separate meaningful gains from spurious gains. It is important to note that although the results may be used to identify potential problems within a school, the identification of a problem is not an accusation of misconduct.

Multiple methods were incorporated into the forensic analysis. The following methods were applied:

- Response Change Analysis
- Score Fluctuation Analysis
- Item Exposure Monitoring
- Web Monitoring
- Plagiarism Detection

### 4.5.1 Response Change Analysis

Students make changes to answer choices when taking the LEAP 2025, and this is expected behavior. Unfortunately, changing student answers is also an opportunity for school personnel to improve classroom performance and, therefore, the response change analysis focuses on identifying school- and testadministrator level response-change patterns that are statistically improbable when compared to the expected pattern at the state level.

### 4.5.2 Score Fluctuation Analysis

It is anticipated that performance on the LEAP 2025 will improve over time from legitimate sources such as changes in the curriculum and improvement in instruction. However, large and unexpected score changes may be a sign of testing impropriety. The LDOE applied an approach where the state's level of change in performance from one year to the next is compared to a schools' and test administators' change in
performance during the same time frame. Schools and test administrators were identified when the level of change was statistically unexpected.

### 4.5.3 Item Exposure Monitoring

Due to re-use of the 2019 operational forms for the spring of 2021 administration, item performance was examined to ensure that item content had not been exposed. Freuquently during the testing window, every item's moving $p$-value and point-biserial averages were produced. If an item's moving average $p$-value was larger than expected compared to the previous administration's the item was flagged. Additionally, plots were produced for a visual inspection of the day-to-day patterns of item performance.

### 4.5.4 Web Monitoring

LEAP 2025 operational test content should not appear outside the boundaries of the forms administered. To protect Louisiana test content, the internet is monitored for postings which contain, or appear to contain, potentially exposed and/or copied LDOE test content. When test content is verified, steps are taken so that the infringing content is removed quickly.

### 4.5.5 Plagiarism Detection

The LDOE monitors for two different plagiarism situations: copying from student to student and copying from an outside source, such as Wikipedia or another internet sources. Instances of plagiarism are identified regardless if an item is scored by human scorers or artificial intelligence. Alerts are set to identify responses that may indicate the possibility of teacher interference, plagiarism, or disturbing content (e.g., possible physical or emotional abuse, suicidal ideation, threats of harm to themselves or others, etc.). Alerted responses are given additional review so the appropriate response can be taken.

### 4.6 Test Administration

The 2021 assessments were administered to students within the state testing window of April 26 through May 26, 2021. The paper testing window was April 28 through 30, 2021. Each session of the assessment within each content area of the LEAP 2025 assessments was required to be administered in one block of time.

All sessions of the ELA and mathematics LEAP 2025 assessments were timed. Only students with an extended time accommodation were permitted to exceed the established time limits of any given session. The timing schedule of the LEAP 2025 assessments is presented in Table 4.1.

Table 4.1 LEAP 2025 Administration Schedule Timing Guidelines by Session (Time in Minutes)

| Grade | Session | English <br> Language Arts | Mathematics |
| :---: | :---: | :---: | :---: |
| 3 | 1 | 75 | 75 |
|  | 2 | 75 | 85 |
|  | 3 | 60 | 75 |
| 4 | 1 | 90 | 75 |
|  | 2 | 90 | 85 |
|  | 3 | 60 | 75 |

| 5 | 1 | 90 | 75 |
| :---: | :---: | :---: | :---: |
|  | 2 | 90 | 85 |
|  | 3 | 60 | 75 |
| 6 | 1 | 90 | 60 |
|  | 2 | 90 | 90 |
|  | 3 | 80 | 90 |
| 7 | 1 | 90 | 60 |
|  | 2 | 90 | 90 |
|  | 3 | 80 | 90 |
|  | 1 | 90 | 60 |
|  | 2 | 90 | 90 |
|  | 3 | 80 | 90 |

### 4.6.2 Accommodations

Accommodations are allowed on the LEAP 2025 assessments. Accommodations may be used by a student who qualifies under the Individual with Disabilities Act (IDEA), has an IEP or a Section 504 plan of the Americans with Disabilities Act, or identifies as an English learner (EL). Accommodations must be specified in the qualifying student's individual plan and must be consistent with accommodations used during daily classroom instruction and testing. The use of any accommodation must be indicated on the student information sheet at the time of test administration. AERA, APA, \& NCME Standard 6.2 states:

When formal procedures have been established for requesting and receiving accommodations, test takers should be informed of these procedures in advance of testing (115).
In compliance with this standard, the LEAP 2025 Test Administration Manual contains the list of universal tools, designated supports, and accommodations permissible for the LEAP 2025 assessments. Further guidance can be found in the LEAP 2025 Accommodations and Accessibility Features User Guide.

Visually impaired students may be provided braille forms for any assessment and large print forms for the PBT.

Tables 4.2 through 4.5 summarize the numbers of reportable students receiving accommodations by accommodation type for the 2021 LEAP 2025. Accommodation assignment guidance is provided in the LEAP 2025 Accommodations and Accessibility User Guide. Accommodations are grouped into four sections: special education accommodation, English learner status accommodation, Section 504 status accommodation, and online accommodation. The analyses are based on census data and the number includes only those students who received accommodations and received a scale score on the ELA or mathematics LEAP 2025 assessments. The percentage represents the percentage of the census population receiving that accommodation. The students who are included in the "No Accommodation" category are students who are eligible for an accommodation but have indicated that none was used.

Table 4.2 Number and Percentage of Students Receiving Special Education Accommodations by Accommodation Type, as Bubbled on the Test Booklet

| Special Education Accommodation Type |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | English Language Arts |  | Mathematics |  |

### 4.7 Summary

In summary, the overall purpose of each of the test administration trainings and the ancillary materials is to keep school systems informed about policies and procedures related to testing in general and the LEAP 2025 program in particular. The information imparted is clearly related to standardizing the administration of the LEAP 2025, maintaining the security of the assessment, allowing access to the assessments for special
populations by clearly delineating appropriate accommodations, and maintaining integrity of the scores. These communication and training efforts by the LDOE and the ancillary information developed by DRC address multiple best practices of the testing industry but, in particular, are related to the following standards:

Standard 4.15 The directions for test administration should be presented with sufficient clarity so that it is possible for others to replicate the administration conditions under which the data on reliability, validity, and (where appropriate) norms were obtained. Allowable variations in administration procedures should be clearly described. The process for reviewing requests for additional testing variations should also be documented (90).
Standard 6.1 Test administrators should follow carefully the standardized procedures for administration and scoring specified by the test developer and any instructions from the test user (114).

Standard 6.3 Changes or disruptions to standardized test administration procedures or scoring should be documented and reported to the test user (115).

Standard 6.4 The testing environment should furnish reasonable comfort with minimal distractions to avoid construct-irrelevant variance (116).
Standard 6.6 Reasonable efforts should be made to ensure the integrity of test scores by eliminating opportunities for test takers to attain scores by fraudulent or deceptive means (116).
Standard 6.7 Test users have the responsibility of protecting the security of test materials at all times (117).

## Chapter 5: Scoring of Constructed-Response and TechnologyEnhanced Items

In this chapter, the scoring process used for the 2021 LEAP 2025 ELA and mathematics assessment is described, with a particular focus on the handscoring of constructed-response items and the automated scoring of technology-enhanced items. At the end of this section, the results of the inter-rater reliability for the handscoring of the LEAP 2025 constructed-response items are presented.

Chapter 5 adheres to the American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards 4.18, 4.20, 6.8, and 6.9. Each standard is presented in the pertinent section of this chapter. Standard 4.18 provides some general guidance for Chapter 5:

Procedures for scoring and, if relevant, scoring criteria, should be presented by the test developer with sufficient detail and clarity to maximize the accuracy of scoring. Instructions for using rating scales or for deriving scores obtained by coding, scaling, or classifying constructed responses should be clear. This is especially critical for extended-response items such as performance tasks, portfolios, and essays (91).

Chapter 5 explains the procedures used for scoring the LEAP 2025 ELA and mathematics constructedresponse items and technology-enhanced items. The scoring criteria used for each item are not presented in this chapter to preserve the integrity of the items for future use.

### 5.1 Constructed-Response Item Scoring Process

Constructed-response items were scored by human raters who were trained by DRC. Handscoring and Artificial Intelligence (AI) processing rules are detailed in Appendix C. Seven ELA items across grades 5-8 ELA (noted in the table below) were scored by an Al engine, Pearson's Intelligent Essay Assessor (IEA), using scoring models previously developed by Pearson. Second reads of $10 \%$ of these responses were completed by human scorers; handscoring supervisors also reviewed the responses that IEA was not able to score.

## Table 5.1 Constructed-Response Scoring

| Subject and <br> Grade | Handscoring Only | Al Scoring | Al Vendor |
| :--- | :--- | :--- | :--- |
| ELA grade 3 | Q7, Q12 | N/A |  |
| ELA grade 4 | Q7, Q20 | N/A |  |
| ELA grade 5 | Q20 | Q7 | Pearson |
| ELA grade 6 | N/A | Q9, Q14 | Pearson |
| ELA grade 7 | N/A | Q9, Q14 | Pearson |
| ELA grade 8 | N/A | Q7, Q20 | Pearson |
| Math grades 3-8 | All CRs | N/A |  |

### 5.1.1 Selection of Scoring Evaluators

Standard 4.20 states the following:
The process for selecting, training, qualifying, and monitoring scorers should be specified by the test developer. The training materials, such as the scoring rubrics and examples of test takers' responses that illustrate the levels on the rubric score scale, and the procedures for training scorers should result in a degree of accuracy and agreement among scorers that allows the scores to be interpreted as originally intended by the test developer. Specifications should also describe processes for assessing scorer consistency and potential drift over time in raters' scoring (92).

The following sections explain how scorers were selected and trained for the LEAP 2025 ELA and mathematics handscoring process. Section 5.1.3 describes how the scorers were monitored throughout the handscoring process.

## The Recruitment and Interview Process

DRC strives to develop a highly qualified, experienced core of evaluators to appropriately maintain the integrity of all projects.

All readers hired by DRC to score 2021 LEAP 2025 ELA and mathematics test responses had at least a fouryear college degree. DRC has a human resources director dedicated solely to recruiting and retaining the handscoring staff. Applications for reader positions are screened by the handscoring project manager, the human resources director, or recruiting staff to create a large pool of potential readers. In the screening process, preference is given to candidates with previous experience scoring large-scale assessments and with degrees emphasizing the appropriate content areas. At the personal interview, reader candidates are asked to demonstrate their proficiency in writing by responding to a DRC writing topic and their proficiency in mathematics by solving word problems with correct work shown. These steps result in a highly qualified and diverse workforce. DRC personnel files for readers and team leaders include evaluations for each project completed. DRC uses these evaluations to place individuals on projects that best fit their professional backgrounds, their college degrees, and their performances on similar projects at DRC. Once placed, all readers go through rigorous training and qualifying procedures specific to the project on which they are placed. Any scorer who does not complete this training and demonstrate the ability to apply the scoring criteria by qualifying at the end of the process is not allowed to score live student responses.

### 5.1.2 Security

Whether training and scoring are conducted within a DRC facility or done remotely, security is essential to our handscoring process. When users log into DRC's secure, web-based scoring application, ScoreBoard, they are required to read and accept our security policy before they are allowed to access any project. For each project, scorers are also required to read and sign non-disclosure agreements, and during training emphasis is always given to what security means, the importance of maintaining security, and how this is accomplished.

Readers only have access to student responses they are qualified to score. Each scorer is assigned a unique username and password to access DRC's imaging system and must qualify before viewing any live student responses. DRC maintains full control of who may access the system and which item each scorer may score. No demographic data is available to scorers at any time.

### 5.1.3 Handscoring Training Process

Standard 6.9 specifies:

Those responsible for test scoring should establish and document quality control processes and criteria. Adequate training should be provided. The quality of scoring should be monitored and documented. Any systematic source of scoring errors should be documented and corrected (118).

## Training Material Development

DRC scoring supervisors trained scorers using training materials from two sources.

1. PARCC-approved training materials provided by New Meridian for ELA and math. These materials include the following:

- Passages, prompts, and associated stimuli
- Rubrics
- Anchor sets
- Practice sets
- Qualifying sets (for prototype items only)

2. Math training materials developed by DRC in conjunction with and approved by the LDOE. These materials were made for use with DRC-developed math items (which were newly operational in the spring of 2019) according to processes described in DRC's response to the LDOE's "REQUEST FOR PROPOSALS For LEAP 2025 Assessment Administration (RFP \#: 815200-20150723001)".

- Prompts
- Rubrics
- Anchor sets
- Practice sets
- Qualifying sets (for all DRC-developed items)

## Training and Qualifying Procedures

Handscoring involves training and qualifying team leaders and evaluators, monitoring scoring accuracy and production, and ensuring security of both the test materials and the scoring facilities. The LDOE visits the scoring centers to review training materials and oversee the training process. An explanation of the training and qualification procedures follows.

DRC used the PARCC-approved mathematics and ELA training and qualifying materials to score two categories of items: "prototype" items and "abbreviated" items. Note that, like the PARCC "prototype" items for math, full sets of training and qualifying materials were also developed for all DRC-developed math items. The training and qualifying procedures DRC used for these items was the same process outlined below for PARCC-approved "prototype" math items.

## Prototype Items

Only one item (for grade 7 math) included in the 2021 Louisiana forms was a prototype item, meaning it had a full set of associated training materials, including anchor set, practice sets, and qualifying sets. DRC started the training process with a review of the item, rubric, and anchor set, followed by the scoring and discussion
of practice sets and qualifying sets. Once this process was completed, qualified readers started scoring live student responses for that item.

## Abbreviated Items

Abbreviated items required a two-step training and qualifying process. First, scorers trained and qualified as described above using PARCC-approved materials for an associated prototype item that was similar to the abbreviated one they would be scoring on the Louisiana form. ${ }^{2}$ Readers who did not qualify on the prototype item training were not allowed to continue the training.

After qualifying on the associated prototype item training, readers received additional item-specific training on the abbreviated item they were going to score. This consisted of an item-specific anchor set and two itemspecific practice sets. After completing the abbreviated item training, the readers could begin scoring live student responses for the abbreviated item.

The following tables detail the composition of the training materials provided by Pearson for mathematics and ELA.

Table 5.2 Mathematics Training Set Composition

| Set Type | Prototype Item <br> Training | Abbreviated Item Training | Annotated |
| :--- | :--- | :--- | :--- |
| Anchor Set | 3 responses per score point <br> (Composite items had 3 <br> responses per composite <br> score.) | 3 responses per score point <br> (Composite items had 3 <br> responses per composite <br> score.) | Yes |
| Practice Set 1 | 10 responses representing the <br> range of responses | 10 responses representing the <br> range of responses | Yes |
| Practice Set 2 | 10 responses representing the <br> range of responses | 10 responses representing the <br> range of responses | Yes |
| Qualifying Set 1 | 10 responses comparable to <br> the anchor set responses | No |  |
| Qualifying Set 2 | 10 responses comparable to <br> the anchor set responses | No |  |
| Qualifying Set 3 | 10 responses comparable to <br> the anchor set responses | No |  |
| *For DRC-developed math items, examples of responses at the top score points may not have <br> been present in some anchor, training, and qualifying sets as there were few or no examples <br> found during rangefinding or subsequent field test scoring. In such cases, DRC Scoring Directors <br> identified examples of these scores during live scoring to supplement reader training. |  |  |  |

[^1]Table 5.3 ELA Training Set Composition

| Set Type | Prototype Item Training | Abbreviated Item Training | Annotated |
| :---: | :---: | :---: | :---: |
| Anchor Set* | 3 responses per score point | 16 responses per item: <br> Anchor Sets for abbreviated RST and LAT item training included scores for the combined trait Reading <br> Comprehension and Written Expression (RCWE). <br> Anchor Sets for abbreviated NWT item training included scores for Written Expression (WE). | Yes |
| Practice <br> Set 1 | 5 responses representing the range of responses for <br> the Reading Comprehension and Written Expression (RCWE) trait (for LAT and RST items) <br> the Written Expression trait (for NWT items) | 10 responses representing the range of responses for the trait appropriate to the task type | Yes |
| Practice <br> Set 2 | 5 responses representing the range of responses for the Knowledge and Use of Language Conventions trait | 10 responses representing the range of responses for the conventions trait | Yes |
| Practice Set 3 | 10 responses representing the range of responses for both traits appropriate to the task type |  | Yes |
| Practice Set 4 | 10 responses representing the range of responses for both traits appropriate to the task type |  | Yes |
| Qualifying Set 1 | 10 responses comparable to the anchor set responses (included both traits appropriate to the task type) |  | No |
| Qualifying Set 2 | 10 responses comparable to the anchor set responses (included both traits appropriate to the task type) |  | No |
| Qualifying Set 3 | 10 responses comparable to the anchor set responses (included both traits appropriate to the task type) |  | No |
| Direct <br> Copy <br> Set** | 3-5 responses composed entirely or partially of text copied from passage or passages (included both traits appropriate to the task type) | 3-5 responses composed entirely or partially of text copied from passage or passages (included both traits appropriate to the task type) | Yes |

*For the ELA Knowledge and Use of Language Conventions trait, there were two mixed-prompt anchor sets per grade level (one for the narrative task and the other for the literary analysis and research simulation tasks). In addition to the mixed-prompt anchor set, depending on the task, the practice sets for prototype and abbreviated items required readers to practice scoring the Knowledge and Use of Language Conventions trait along with the Reading Comprehension and Written Expression trait (for LAT and RST items) or with the Written Expression trait (NWT). Readers were also required to qualify on the Knowledge and Use of Language Conventions trait during each prototype item qualifying session.
**These PARCC-approved sets provided additional annotated sample responses explaining the scoring rationale for responses composed entirely or partially of text copied from the source passage(s) associated with an item. DRC scoring supervisors reviewed these item-specific sets with the readers prior to scoring the associated item.

Some items selected for use on the spring 2021 administration were previously only field tested by PARCC. Consequently, the abbreviated training materials available for use with these items were abridged versions of typical abbreviated sets of materials. They consisted of:

- An Anchor Set (for ELA, some have annotations and some lack examples of the top scores)
- One Practice Set of 5 responses (scored but not annotated in the case of ELA)
- Approximately 10 validity responses

Since these materials were somewhat limited compared to typical abbreviated materials (the main difference being a lack of formal written annotations and fewer practice responses), DRC bolstered the training in 2019 by using the PARCC-approved field test validity responses provided by New Meridian as additional practice responses. DRC Scoring Directors then pulled additional responses from operational Louisiana student responses to use as validity responses during the scoring window. The Scoring Directors also found examples of higher-scoring responses that might be missing from the field test anchors. The validity and additional exemplar responses, along with the DRC Scoring Directors' notes for all papers used during the training of the abbreviated field-test only items, were submitted to the LDOE for approval. It is important to note that readers still had to qualify via standard qualification procedures on the prototype items for all items by first going through full training with the appropriate prototype Anchor Set, Practice Sets 1-4, and Qualifying Sets 1-3 (as well as the Conventions sets). The sets updated in 2019 were used during the 2021 scoring process.

## Qualifying Standards

DRC followed the same qualification standards that Pearson used for PARCC. A description of these PARCC qualifying standards follows.

Scorers demonstrated their ability to apply the scoring criteria by qualifying (i.e., scoring with acceptable agreement with true scores on qualifying sets). After each qualifying set was scored, the DRC scoring director responsible for training led the scorers in a discussion of the set.

Any scorer who did not qualify by the end of the qualifying process for an item was not allowed to score live student responses.

Table 5.4 Mathematics Qualifying Standards

|  | Perfect Agreement | Perfect Plus Adjacent Agreement |
| :--- | :--- | :--- |
| $0,1,2$ Rubric | $80 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3$ Rubric | $70 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3,4$ Rubric | $70 \%$ on two of three sets | $95 \%$ on two of three sets |

Table 5.5 Mathematics Qualifying Standards (Composite Items)*

| Composite (multipart) Items | Perfect Agreement | Perfect Plus Adjacent Agreement |
| :--- | :--- | :--- |
| 0,1 Rubric | $90 \%$ on two of three sets | $100 \%$ on two of three sets |
| $0,1,2$ Rubric | $80 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3$ Rubric | $70 \%$ on two of three sets | $96 \%$ on two of three sets |
| $0,1,2,3,4$ Rubric | $70 \%$ on two of three sets | $95 \%$ on two of three sets |

*For mathematics composite items, the appropriate qualifying standard had to be achieved on each part of the item. For example, if an item had Part A with a top score of 1, Part B with a top score of 2, and Part C with a top score of 3 , a scorer/supervisor would need to achieve $90 \%$ perfect agreement on Part A, $80 \%$ perfect agreement on Part $B$, and $70 \%$ perfect agreement on Part $C$, with no more than one nonadjacent score per part across all three qualifying sets.

## Table 5.6 ELA Qualifying Standards

| Perfect Agreement | Perfect Plus Adjacent Agreement |
| :--- | :--- |
| 70\% average for both traits on two of three <br> qualifying sets | $96 \%$ across the three qualifying sets combined <br> on both traits |
| 70\% on each trait at least once across three <br> qualifying sets |  |

ELA readers were required to meet all three of the qualifications listed in Table 5.6. Perfect plus adjacent agreement of $96 \%$ means that out of the entire pool of scores that a reader gave across the three qualifying sets for an item, no more than $4 \%$ of those scores could be nonadjacent. In other words, no more than 2 of the 60 applied scores could be nonadjacent ( 3 sets $\times 10$ responses/set $\times 2$ traits $=60$ applied scores).

### 5.1.4 Monitoring the Scoring Process

Standard 6.8 states:

Those responsible for test scoring should establish scoring protocols. Test scoring that involves human judgment should include rubrics, procedures, and criteria for scoring. When scoring of complex responses is done by computer, the accuracy of the algorithm and processes should be documented (118).

Section 5.1.4 explains the monitoring procedures that DRC uses to ensure that handscoring evaluators follow established scoring criteria while items are being scored. Detailed scoring rubrics, which specify the criteria for scoring, are available for handscoring evaluators for all constructed-response items.

## Reader Monitoring Procedures

Throughout the handscoring process, DRC project managers, scoring directors, and team leaders reviewed the statistics that were generated on a daily basis. DRC used one team leader for every 10 to 12 readers, which was the same ratio that Pearson used for PARCC. If scoring concerns were apparent among individual scorers, team leaders dealt with those issues on an individual basis. If a scorer appeared to need clarification of the scoring rules, DRC supervisors typically monitored one out of five of the scorer's readings, making adjustments to that ratio as needed. If a supervisor disagreed with a reader's scores during monitoring, they provided retraining in the form of direct feedback to the reader, using rubric language and applicable training responses.

## Validity Sets and Inter-Rater Reliability

In addition to the feedback that supervisors provided to readers during regular read-behinds and the continuous monitoring of inter-rater reliability and score point distributions, DRC also conducted validity scoring. Validity responses were inserted among the live student responses.

The validity responses were added to DRC's image handscoring system prior to the beginning of scoring. Validity reports compared readers' scores to pre-determined scores and were used to help detect potential room drift and individual scorer drift. This data was used to make decisions regarding the retraining and/or release of scorers, as well as the rescoring of responses.

Approximately $10 \%$ of all live student responses were scored by a second reader to establish inter-rater reliability statistics for all constructed-response items. This procedure is called a "double-blind read" because the second reader does not know the first reader's score. DRC monitored inter-rater reliability based on the responses that were scored by two readers. If a scorer fell below the expected rate of agreement, the team
leader or scoring director retrained the scorer. If a scorer failed to improve after retraining and feedback, DRC removed the scorer from the project. In this situation, DRC removed all scores assigned by the scorer in question. The responses were then reassigned and rescored.

To monitor inter-rater reliability, DRC produced scoring summary reports on a daily basis. DRC's scoring summary reports display exact, adjacent, and nonadjacent agreement rates for each reader. These rates are calculated based on responses that are scored by two readers, and their definitions are included below.

- Percentage Exact (\%EX)-total number of responses by reader where scores are the same, divided by the number of responses that were scored twice
- Percentage Adjacent (\%AD)—total number of responses by reader where scores are one point apart, divided by the number of responses that were scored twice
- Percentage Nonadjacent (\%NA)—total number of responses by reader where scores are more than one score point apart, divided by the number of responses that were scored twice

The following table provided by Pearson shows the expectations for validity and inter-rater reliability:
Table 5.7 Expectations for Validity and Inter-Rater Reliability

| Agreement Rate Requirements for Validity and Inter-Rater Reliability |  |  |  |
| :--- | :--- | :--- | :--- |
| Content <br> Area | Score Point Range | Perfect Agreement | Perfect Agreement + <br> Adjacent |
| Mathematics | $0-1$ | $90 \%$ | $100 \%$ |
| Mathematics | $0-2$ | $80 \%$ | $95 \%$ |
| Mathematics | $0-3$ | $70 \%$ | $95 \%$ |
| Mathematics | $0-4$ | $65 \%$ | $95 \%$ |
| ELA | Multi-trait 0-3 or 0-4 <br> (varies by grade and <br> trait) | $65 \%$ (each trait) | $96 \%$ (each trait) |

Each reader was required to maintain a level of exact agreement on validity responses and on inter-rater reliability as shown under "Perfect Agreement" in the table above. Additionally, readers were required to maintain an acceptably low rate of nonadjacent agreement. To monitor this, DRC summed each reader's exact and adjacent agreement rates and required each reader to maintain the levels shown under "Perfect Agreement + Adjacent" in the table above.

## Calibration Sets

Pearson provided DRC with PARCC-approved calibration responses for all operational items that came from the PARCC item pool. DRC pulled calibration responses for DRC-developed math items as well as additional responses for items from PARCC. DRC used these sets to perform calibration across the entire scorer population for an item if trends were detected (e.g., low agreement between certain score points if a certain type of response was missing from initial training). These calibrations were designed to help refocus scorers on how to properly use the scoring guidelines. They were selected to help illustrate particular points and familiarize scorers with the types of responses commonly seen during operational scoring. After readers scored a calibration set, the scoring director reviewed it with the readers, using rubric language and scoring concepts exemplified by the anchor responses to explain the reasoning behind each response's score.

## Reports and Reader Feedback

Reader performance and intervention information were recorded in reader feedback logs. These logs tracked information about actions taken with individual readers to ensure scoring consistency in regard to reliability, score point distribution, and validity performance. In addition to the reader feedback logs, DRC provided the LDOE with handscoring quality control reports for review throughout the scoring window. Further detail about these reports can be found in Appendix C.

### 5.2 Inter-Rater Reliability

A minimum of $10 \%$ of the constructed responses in ELA and mathematics were scored independently by a second reader. This was the case regardless of whether the first reader was human or AI. The statistics for inter-rater reliability were calculated for all items at all grades. To determine the reliability of scoring, the percentage of perfect agreement and adjacent agreement between the first and second scores was examined.

A total of 51 operational items were scored by human readers across all grades and both content areas. The inter-rater reliability rates and the total numbers of reads are shown in Table 5.8 for ELA items, Table 5.9 for operational mathematics items, and Table 5.10 for Spanish mathematics items.

As shown in Table 5.8, raters demonstrated at least 99\% perfect and adjacent agreement for all ELA handscored items. As shown in Table 5.9 raters demonstrated at least $98 \%$ perfect and adjacent agreement for mathematics items. As shown in Table 5.10, raters demonstrated 100\% perfect and adjacent agreement for Spanish mathematics items.

*Total Exact (EX) + Adjacent (AD) does not add up to 100\% due to rounding
${ }^{* *} N / A$ if an item does not have multiple parts

All technology-enhanced items, as well as EBSR, MPSR, and SA items, were processed through DRC's autoscoring engine and scored according to the assigned scoring rules as established during content creation by PARCC or DRC as applicable in conjunction with the LDOE. DRC ensured that all rubrics and scoring rules were verified for accuracy before scoring any technology-enhanced items. DRC established an adjudication process for technology-enhanced items and short-answer responses to verify that correct answers were identified. DRC's technology-enhanced scoring process included the following procedures:

- A scoring rubric was created for each technology-enhanced item. The rubric described the one and only correct answer for dichotomously scored items (i.e., items scored as either right or wrong). If partial credit was possible, the rubric described in detail the type of response that could receive credit for each score point.
- The information from the scoring rubric was entered into the scoring system within the item banking system so that the truth resided in one place along with the item image and other metadata. This scoring information included details that varied by item type. For example, for a drag-and-drop item, the information included which objects are to be placed in each drop region to receive credit.
- The information was then verified by another autoscoring expert.
- After testing started, reports were generated that showed every response, how many students gave that response, and the score the scoring system provided for that response.
- The scoring was then checked against the scoring rubric using two levels of verification.
- If any discrepancies were found, the scoring information was modified and verified again. The scoring process was then rerun. This checking and modification process continued until no other issues were found.
- As a final check, a final report was generated that showed all student responses, their frequencies, and their received scores.

In the case of braille and large-print test forms, student responses to items were transcribed into the online system by a test administrator.

### 5.3 Multiple-Choice and Multiple-Select Item Scoring Process

Responses to multiple-choice and multiple-select items were captured during the CBT administration and during scanning of the PBT answer documents. In the case of braille and large-print test forms, student responses to these items were transcribed into the online system by a test administrator.

### 5.4 Summary

The information presented in this chapter summarizes the scoring procedures for different types of items and the steps taken by DRC to ensure accuracy in the autoscoring and handscoring processes. The inter-rater reliability statistics presented in Section 5.4 demonstrate that the items were scored reliably. These efforts by DRC address multiple best practices of the testing industry but are particularly related to AERA, APA, \& NCME (2014) Standards 4.18, 4.20, 6.8, and 6.9:

Standard 4.18 Procedures for scoring and, if relevant, scoring criteria, should be presented by the test developer with sufficient detail and clarity to maximize the accuracy of scoring. Instructions for
using rating scales or for deriving scores obtained by coding, scaling, or classifying constructed responses should be clear. This is especially critical for extended-response items such as performance tasks, portfolios, and essays (91).

Standard 4.20 The process for selecting, training, qualifying, and monitoring scorers should be specified by the test developer. The training materials, such as the scoring rubrics and examples of test takers' responses that illustrate the levels on the rubric score scale, and the procedures for training scorers should result in a degree of accuracy and agreement among scorers that allows the scores to be interpreted as originally intended by the test developer. Specifications should also describe processes for assessing scorer consistency and potential drift over time in raters' scoring (92).

Standard 6.8 Those responsible for test scoring should establish scoring protocols. Test scoring that involves human judgment should include rubrics, procedures, and criteria for scoring. When scoring of complex responses is done by computer, the accuracy of the algorithm and processes should be documented (118).

Standard 6.9 Those responsible for test scoring should establish and document quality control processes and criteria. Adequate training should be provided. The quality of scoring should be monitored and documented. Any systematic source of scoring errors should be documented and corrected (118).

## Chapter 6: Operational Data Analyses

This chapter of the LEAP 2025 technical report describes the analyses that were conducted on the operational data. These include a classical item analysis and examination of the raw scores and an item response theory (IRT) analysis involving calibrating, scaling, and linking.

This section presents the classical item statistics, including aggregate raw score statistics and individual itemlevel statistics. Next, this section discusses the IRT models used for calibrating the data and addresses the purpose of data calibration and scaling for each content area is addressed. The lowest obtainable scale score (LOSS) and highest obtainable scale score (HOSS) for the LEAP 2025 tests are also presented.

Chapter 6 demonstrates how LEAP 2025 assessments adhere to American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards $1.8,4.14,5.2,5.13,5.15$, and 7.2 . Each standard is explicated within the appropriate section of this chapter. Standard 7.2 provides general guidance that is relevant to this chapter. It states the following:

The population for whom a test is intended and specifications for the test should be documented (126).

For all 2021 LEAP 2025 analyses, the Louisiana student population was used. Chapter 3 presents the test specifications. Information regarding reported data is discussed in detail in Chapter 7.

In this section, summary test statistics for each form, grade, and content area of LEAP 2025 are presented. These statistics are followed by item-level statistics for each grade and content area of LEAP 2025. These statistics were produced using census data.

### 6.1 Test-Level Statistics

Table 6.1 presents the number of items, score points, mean and standard deviation of the raw scores, and average form difficulty for each test form at each grade level of the ELA and mathematics assessments, respectively. Form difficulty for an examinee was calculated by dividing the raw score of the student by total score points of the test.

As can be seen in the table, average form difficulty for ELA ranged from 0.30 to 0.43 . Average form difficulty for mathematics ranged from 0.28 to 0.47. In general, the 2021 LEAP 2025 tests were relatively difficult tests across all subjects and grades. For ELA, the grade 3 computer-based test (CBT) was the most difficult, with 0.30 average form difficulty, and the grade 7 was the easiest, with 0.43 average form difficulty. For mathematics, the grade 8 test was the most difficult, with 0.28 average form difficulty, and the grade 3 paper-based test (PBT) test was the easiest, with 0.47 average form difficulty.

Table 6.1 LEAP 2025 Means and Standard Deviations for Raw Scores and Form Difficulty

| Content | Grade | Mode | Total Items | Total Points | Mean Raw Score (Std. Dev.) | Average Form Difficulty (Std. Dev.) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ELA | 3 | CBT | 27 | 71 | 21.12 (12.05) | 0.30 (0.12) |
|  | 3 | PBT | 27 | 71 | 25.42 (12.72) | 0.37 (0.12) |
|  | 4 | CBT | 30 | 86 | 27.42 (16.08) | 0.32 (0.13) |
|  | 4 | PBT | 30 | 86 | 32.31 (16.60) | 0.38 (0.11) |
|  | 5 | CBT | 30 | 86 | 28.09 (15.81) | 0.33 (0.16) |
|  | 6 | CBT | 33 | 90 | 33.63 (17.55) | 0.38 (0.13) |
|  | 7 | CBT | 33 | 90 | 38.39 (19.52) | 0.43 (0.12) |
|  | 8 | CBT | 34 | 94 | 37.23 (18.39) | 0.40 (0.10) |
| Mathematics | 3 | CBT | 43 | 62 | 24.27 (13.47) | 0.39 (0.18) |
|  | 3 | PBT | 43 | 62 | 28.70 (14.23) | 0.47 (0.17) |
|  | 4 | CBT | 42 | 61 | 23.40 (13.52) | 0.39 (0.20) |
|  | 4 | PBT | 42 | 61 | 25.59 (13.90) | 0.43 (0.19) |
|  | 5 | CBT | 38 | 56 | 21.36 (12.25) | 0.38 (0.16) |
|  | 6 | CBT | 40 | 63 | 21.61 (13.58) | 0.35 (0.17) |
|  | 7 | CBT | 43 | 66 | 21.31 (13.22) | 0.33 (0.18) |
|  | 8 | CBT | 37 | 60 | 16.58 (11.01) | 0.28 (0.16) |

Table 6.2 presents the number of items, mean and standard deviation of the item $p$-values, and item-total correlations (i.e., item discrimination values) for each test form at each grade level of the ELA and mathematics assessments, respectively.

The mean $p$-value is the average of all item $p$-values of a specific grade and content area. The mean itemtotal correlation ( $\mathrm{R}_{\mathrm{it}}$ ) is the average of all item point-biserial correlations of a specific grade and content area. The $p$-value and item-total correlation are explained in the next section.

Table 6.2 LEAP 2025 Means, Standard Deviations for Raw Scores, $p$-Values, Item-Total Correlation ( $\mathrm{R}_{\mathrm{it}}$ )

|  |  |  |  | Item $p$-Value |  |  |  | Item-Total Correlation |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Content | Grade | Mode | N of Items | Mean | Std. <br> Dev. | Min. | Max | Mean | Std. <br> Dev. | Min. | Max |
|  | 3 | CBT | 27 | 0.34 | 0.12 | 0.15 | 0.59 | 0.45 | 0.13 | 0.22 | 0.66 |
|  | 3 | PBT | 27 | 0.40 | 0.13 | 0.24 | 0.65 | 0.44 | 0.12 | 0.23 | 0.65 |

### 6.2 Item-Level Statistics

Tables 6.3-6.10 present the item statistics for each operational item included in regular test forms organized by grade for ELA. Tables 6.11-6.18 show the item statistics for each item included in regular test forms organized by grade for mathematics. The tables include administration mode, item number, $p$-value, itemtotal correlation ( $\mathrm{R}_{\mathrm{it}}$ ), omit rates, total N , adjusted N (adjusted N excludes items with multiple responses [PBT only], omitted responses, responses that were not scored, or responses that received a non-score code), and the percentage at each score point, if applicable, for each item by grade and content area. The $p$-value and item-total correlations calculations used the adjusted N to determine the values. The rest of the statistics in the table are based on the total N .

## $p$-Value

The $p$-value is a measure of item difficulty. For a multiple-choice (MC) item, the $p$-value is calculated by dividing the number of students who correctly responded to an item by the total number of students who attempted the item. The value is reported as a proportion. For a non-MC item, the $p$-value is calculated by dividing the average score for the item by the maximum points possible. This value is also reported as a proportion.

In terms of $p$-values, test scores tend to be more precise when their average $p$-values are between the mid0.50 s and the low 0.70 s . However, it is important to select items on the basis of content rather than on purely statistical criteria when building a criterion-referenced test. As shown in Table 6.2, the average $p$ values associated with the ELA forms range from 0.34 in the grade 3 CBT form to 0.46 in grade 7 . The average $p$-values associated with the mathematics forms range from 0.31 in grade 8 CBT to 0.53 in grade 3 PBT.

It is important that one examines the range of $p$-values, not just the average $p$-value, to determine whether a test measures well. It is desirable for a test to measure well throughout the range of skills present at a given grade. That is, it is important that the items measure the performance of students of all levels of achievement, not just students in the center of the distribution. Having a range of $p$-values also helps to prevent floor and/or ceiling effects so that the test does not have large numbers of students at the minimum or maximum possible scores. The ELA forms have items with $p$-values ranging from 0.13 to 0.74 (see Tables 6.3-6.10) across all grade levels. The $p$-values on the mathematics forms range from 0.06 to 0.89 (see Tables 6.11-6.18). Such a broad range of $p$-values, which indicates the items measure well throughout the range of skill levels at a given grade, supports the accuracy of the LEAP 2025 test scores.

## Item-Total Correlations

An item-total correlation is the correlation between an item score and the total test score, where the item score is not included in the total score. It indicates how well an item differentiates students across all levels of achievement. In general, items with correlations below 0.20 are said to be poorly discriminating. The majority of the items in the LEAP 2025 had item-total correlations above this threshold. Any item with an item-total correlation below the 0.20 threshold was further analyzed to ensure that the item was correctly keyed.

## Omit Rates

The omit rate for each item indicates the percentage of students who did not answer the item. Omit rates can be used to examine possible speededness issues on tests. A test may be speeded if students do not have adequate time to answer all questions on the test. In general, an item is said to have a high omit rate if more than $5 \%$ of students failed to respond to the item. Evidence of speededness is considered a threat to validity because student test scores may not reflect their ability. Additionally, content validity may be threatened because the items that were not completed are needed to fulfill content blueprint specifications (Lu \& Sireci, 2007).

This examination of omit rates complies with Standard 4.14 of the Standards. This standard is concerned with the speededness of a test and states the following:

For a test that has a time limit, test development research should examine the degree to which scores include a speed component and should evaluate the appropriateness of that component, given the domain the test is designed to measure (90).

The results in this section will show that, overall, student test scores are not adversely affected by the rate at which the students complete the test. In general, students have ample time to complete all sections of the test and there is not a threat to construct or content validity.

The results presented in Tables 6.3-6.18 show that the omit rates for most of the items on the LEAP 2025 regular forms are less than $5 \%$, suggesting that the majority of students were able to complete the test in the prescribed amount of time. There is not an omit rate higher than $9 \%$, and the omit rates for the last items in the tests do not exceed 3\%. These omit rates indicate that 97\% of the students completed the test. Lu \& Sireci (2007) report that the Education Testing Service has used an approach where a test was considered unspeeded if at least $80 \%$ of the examinees reach the last item and all testers reach at least $75 \%$ of the items. The reported omit rates fall within these ranges.

These item level statistics are reviewed at the beginning of the operational analyses process to ensure that items are unflawed and a careful review is given to determine that the answer key is correct.

A multiple-choice ( MC ) item is reviewed during the key check process if

- it has a $p$-value less than 0.25 or move than .95,
- greater number of high-performing students (top 20\%) choosing a distractor than are choosing the key,
- the item-total correlation of the keyed response is less than 0.20 ,
- any of the incorrect answer options yields a positive distractor-total correlation, or
- the percentage of students omitting or not reaching each item is 5 or greater.

Other types of autoscored items are also flagged during the key check for review if

- they have a $p$-value less than 0.30 or more than .80 ,
- the percentage of students who reached any possible score point is less than 3,
- the item-total correlation is less than 0.20 , or
- the flagging criteria for omit item is $15 \%$.

### 6.3 Item Response Theory

Item parameters for items included in the ELA and mathematics tests were estimated using a marginal maximum-likelihood (MML) procedure and the 2-parameter logistic (2PL) model for MC items and the generalized partial credit (GPC) model (Muraki, 1992) for non-MC items. Under the 2PL model, the probability that a student with a trait or scale score of $\boldsymbol{\theta}$ will respond correctly to MC item $j$ is

$$
P_{j}(\theta)=1 /\left[1+\exp \left(-1.7 a_{j}\left(\theta-b_{j}\right)\right)\right]
$$

In the equation, $a_{j}$ is the item discrimination and ${ }_{b_{j}}$ is the item difficulty. Under the GPC model, the probability that a student with a trait or scale score of $\boldsymbol{\theta}$ will respond in category $x$ to partial-credit item $j$ is

$$
\begin{aligned}
P_{j x}(\theta)= & \exp \left[\sum_{k=0}^{x}\left(Z_{j k}(\theta)\right)\right] / \sum_{h=0}^{m_{i}} \exp \left[\sum_{k=0}^{x}\left(Z_{j k}(\theta)\right)\right] \\
& \text { where } z_{j k}(\theta)=D a_{j}\left(\theta-b_{j}+d_{j x}\right)
\end{aligned}
$$

where $d_{j x}$ is the relative difficulty of score category $x$ of item $j$.
The software IRTPRO (Cai, Thissen, \& du Toit, 2011) was used for the IRT calibrations. IRTPRO is a multipurpose program that implements a variety of IRT models associated with mixed-item formats and associated statistics. IRTPRO has been used to calibrate large data sets, such as those of PARCC assessments. The program implements MML estimation techniques for items and MLE estimation of theta.

### 6.4 Calibration and Linking

Item calibration and linking for the LEAP 2025 forms were not performed in the spring of 2021. ELA forms used in the 2020-2021 administration were intact forms previously used in the 2018-2019 administration. New Meridian released some of the mathematics items used on the 2019 operational forms in all grades, but
grade 7. Most items were multiple-choice items. In mathematics grade 3, one released item was replaced with a spring 2018 operational item with the same subclaim and score point. For the other grades, the released items were administered, but not used for scoring. Table 6.19 summarizes the number of released items and the change to the score points when the released items were not counted. The number of released items ranged from one to four across grades. Adjusted scoring tables were created for math using these previously-calibrated and scaled items. For information regarding calibration and linking of these forms, please see the 2019 LEAP 2025 Grades 3-8 Operational Technical Report: English Language Arts and Mathematics.

Table 6.19 Item Statistics—Number of Released Mathematics Items and Final Score Points

| Grade | Spring 2019 Original Form |  | Number of <br> Released Items | Spring 2021 Without Released Items |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total Items | Score <br> Points |  | Total Items | Score <br> Points |
| 4 | 43 | 62 | 1 | 42 | 61 |
| 5 | 41 | 60 | 3 | 38 | 56 |
| 6 | 42 | 65 | 2 | 40 | 63 |
| 8 | 41 | 65 | 4 | 37 | 60 |

### 6.4.1.1. Lowest and Highest Obtainable Scale Scores

A maximum likelihood (MML) procedure cannot produce scale score estimates for students with perfect scores or scores below the level expected when students are guessing. In addition, although MML estimates are available for students with extreme scores other than zero or perfect, occasionally these estimates have standard errors of measurement that are very large, and differences between these extreme values have little meaning. Therefore, scores are established for these students based on a rational but necessary nonMML procedure. These values, which are set separately by grade, are called the lowest obtainable scale score (LOSS) and the highest obtainable scale score (HOSS). All grades and content areas in 2019 LEAP 2025 used the same LOSS and HOSS values. The LOSS value was 650, and the HOSS value was 850.

### 6.4.1.2. Reporting Category and Subcategory Subscores

A student's performance on the ELA reporting categories (i.e., Reading and Writing) and mathematics categories (i.e., Major Content, Additional \& Supporting Content, Expressing Mathematical Reasoning, and Modeling \& Application) is reported in one of three ratings: Weak, Moderate, or Strong.

Additionally, subcategory ratings are reported at the student level for ELA and mathematics. ELA has three subcategories for reading (i.e., literary text, informational text, and vocabulary) and two subcategories for writing (i.e., written expression and knowledge and use of language conventions). Mathematics has subcategories that differ by grade. Subcategory performance is reported in one of three ratings of achievement: Strong, Moderate, or Weak. The 2021 LEAP 2025 reporting categories are summarized in chapter 3 . Please see Table 3.1 for ELA and Table 3.8 and 3.9 for mathematics.

Although the performance ratings are determined only by the items included within a category or subcategory, the level of knowledge and ability needed to achieve a performance rating is connected to the level of knowledge and ability required to reach the subject-level achievement levels in the overall tests: a Weak rating requires similar knowledge and ability as the Unsatisfactory and Approaching Basic achievement
levels, a Moderate rating requires similar knowledge and ability as the Basic achievement level, and a Strong rating requires similar knowledge and ability as the Mastery or Advanced achievement levels.

Reading and writing reporting category scores were produced for ELA assessments only. The reading category score range was 10-90 and the writing category score range was 10-60. The method for scaling categories followed the PARCC methodology (Pearson, 2017). For the reading category, two theta score points corresponding to ELA scale scores of 700 and 750 were used for scaling. Linear transformation constants mapping the two theta points to scale score points of 30 and 50 were calculated. After these transformation values were applied to item parameters belonging to the reading category, a scoring table was generated using the TCC inverse method. A similar approach was applied to scale the writing category, using two scale score points of 30 and 35 . Two cut scores, 40 and 50 for reading and 30 and 35 for writing, were used to produce three performance-level ratings for each category (see Table 6.29 for cut scores for summatives, categories, and subcategories).

For reporting categories in mathematics and subcategories in ELA and mathematics, only performance-level ratings were reported. Therefore, there is no need to scale these scores. Using the item parameters belonging to a given category (mathematics) or subcategory (ELA), a raw-score-to-theta scoring table is generated by applying the TCC inverse method. PARCC estimated $\theta_{L 3}$ and $\theta_{L 4}$ corresponding to scale scores of 725 and 750 for each content/grade using PARCC 2016 operational items by the TCC inverse method, and these values are the same across years. The two raw scores corresponding to $\theta_{\mathrm{L} 3}$ and $\theta_{\mathrm{L} 4}$ are cut scores for the category (mathematics) and subcategory (ELA).

This is also illustrated in Table 6.20.
Table 6.20 Cut Scores for Summative, Reporting Categories, and Subcategories

| Performance <br> Level | Summative <br> Test | Category (ELA) |  | Category <br> (Mathematics)/Subcategory <br> (Mathematics and ELA) |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Reading | Writing |  |
| 1 |  |  |  |  |
| 2 | 700 | 30 | 25 |  |
| 3 | 725 | 40 | 30 | $\theta_{L 3}$ |
| 4 | 750 | 50 | 35 | $\theta_{L 4}$ |
| 5 | Around 800 |  |  |  |

*Subcategory thetas are those from summative tests (i.e., 725 \& 750).
**Yellow highlight shows cut scores for category and subcategory.
The primary purpose of form equating is to establish score equivalency between two (or more) forms. Equivalency is established by first building the forms to be equated according to tight content specifications. Then the form scores are placed on the same scale (by equating), such that students performing on an assessment at the same level of (underlying) achievement should receive the same scale score, although they may not receive the same number-correct score (or raw score). The raw-to-scale-score relationship performs this leveling function based on form-equating studies. Theoretically, differences in the raw-to-scale-score relationship between the two forms can be partially due to differences in the samples utilized for calibration and the differences in item difficulty. The LDOE and DRC strive to maintain equivalent samples or use nearcensus samples over the years, minimizing the potential differences due to the samples. Differences in the raw-to-scale-score relationship, therefore, can be primarily attributed to the differences in item difficulty.

The ELA forms used in the spring 2021 were intact forms with pre-existing raw-to-scale-score tables. The math forms that had released items on them had adjusted raw-to-scale-score tables. The grade 3 math form had a scoring table created using previously-used operational items. Tables 6.21 through 6.32. provide scale
scores at selected percentiles that can be used to compare the distributional characteristics of the spring 2021 forms to previous administrations. Although these scale scores are rounded values, there were differences in the scale-score values for a given percentile across the forms. These variations could arise for several reasons: (1) differences in the proficiency (i.e., achievement) of students in the samples or growth in student achievement across years; (2) unevenness in the respective distributions that combine with the number-correct-to-scale-score scoring method, leaving "gaps" in the scale; or (3) other sources of equating error. Other sources of equating error can include subtle content differences between forms, handscoring differences, or unusual student samples. Some equating errors will always be present between forms. This means that the forms will not measure identically, even under optimal testing conditions. In general, however, the test characteristic function equating techniques will "level" the equated forms through the raw-to-scale-score adjustment.

Table 6.21 Comparisons of Scale Scores at Selected Percentiles—Grade 3 ELA

|  | $\mathbf{2 0 1 6}$ | $\mathbf{2 0 1 7}$ | $\mathbf{2 0 1 8}$ | $\mathbf{2 0 1 9}$ | $\mathbf{2 0 2 1}$ |

|  |  |  |  |  |  |

Additional evidence of comparability can be found by reviewing the test characteristic curves (TCCs) for the LEAP 2025 across administrations, see figures 6.1 and 6.2. For ELA forms and grade 7 mathematics, the 2021 form is the intact 2019 form, and since they would share a curve, they are labeled LEAP2019_2021. For most content areas and grades, the TCCs for the three years were similar across ability ranges. For ELA grade 5 and grade 6, the 2018 forms were slightly easier than the 2017 and 2019/2021 forms for high-performing students. For grade 7, the 2018 and 2019/2021 forms were slightly easier than the 2017 forms. Grade 3 forms have been gradually becoming more difficult from 2017 to 2019/2021. For grade 8, the 2019/2021 form was more difficult than the 2017 and 2018 forms across all ability levels.

For mathematics grades 7 and 8, the 2019 and 2021 and 2017 forms were slightly easier than the 2018 form for low-performing students. For grades 3 and 4, the 2019 and 2021 forms were slightly more difficult than the 2018 forms for low-performing students. For grade 5, the 2019 and 2021 form was easier than the 2017 and 2018 forms for high-performing students. Note that this different form difficulty is adjusted by reporting different scale scores for given raw scores; a scale score of a difficult form is higher than that of an easy form given the same raw score.

Figures 6.3 and 6.4 show SEMs for the 2017-2021 LEAP 2025 assessments. For most content areas and grades, the SEMs were similar across ability ranges, especially in the middle ability ranges.

Figure 6.4 SEM Across Years: Mathematics

In summary, the overall purpose of the operational data analyses is to ensure that the test items, as well as the overall test, are functioning appropriately. Operational data analyses also help maintain the test scale so that test results may be appropriately compared across years. The data analyses undertaken by DRC address multiple best practices of the testing industry but are particularly related to the following standards:

Standard 1.8 The composition of any sample of test takers from which validity evidence is obtained should be described in as much detail as is practical and permissible, including major relevant sociodemographic and developmental characteristics (25).

Standard 4.14 For a test that has a time limit, test development research should examine the degree to which scores include a speed component and should evaluate the appropriateness of that component, given the domain the test is designed to measure (90).

Standard 5.2 The procedures for constructing scales used for reporting scores and the rationale for these procedures should be described clearly (102).

Standard 5.13 When claims of form-to-form score equivalence are based on equating procedures, detailed technical information should be provided on the method by which equating functions were established and on the accuracy of the equating functions (105).

Standard 5.15 In equating studies that employ an anchor test design, the characteristics of the anchor test and its similarity to the forms being equated should be presented, including both content specifications and empirically determined relationships among test scores. If anchor items are used in the equating study, the representativeness and psychometric characteristics of the anchor items should be presented (105).

Standard 7.2 The population for whom a test is intended and specifications for the test should be documented. If normative data are provided, the procedures used to gather the data should be explained; the norming population should be described in terms of relevant demographic variables; and the year(s) in which the data were collected should be reported (126).

## Chapter 7: Test Results

This chapter of the technical report contains information on the results of the spring 2021 LEAP 2025 ELA and mathematics assessments. The scale score results and achievement level information are presented here. Presenting the results by achievement level translates the quantitative scale provided through scale scores into a qualitative description of student achievement. The levels are Advanced, Mastery, Basic, Approaching Basic, and Unsatisfactory.

While the scale score provides an essential quantitative reference for student achievement, the achievement-level information plainly outlines the meanings of the scores to parents, students, and educators. When combined, scale scores and achievement levels provide a comprehensive set of tools to assess Louisiana student achievement by content and grade level.

This chapter also provides descriptions of the score reports, data structure, and interpretive guide. The American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards for Educational \& Psychological Testing addressed in Chapter 7 are 5.1, 6.10, 7.0, and 12.18. Each standard is presented in the pertinent section of this chapter.

The results presented in this chapter are based on census data. The results presented here may differ slightly from the official state summary report of all student populations due to ongoing resolution of test materials and student information. The results in the tables in this chapter are presented as evidence of the reliability and validity of the scores from the LEAP 2025 assessments and should not be used for state accountability purposes.

The following are subgroups reported during the administration of the LEAP 2025 tests:

- Gender: Female and Male
- Race and Ethnicity: Hispanic/Latino, American Indian or Alaska Native, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, White, and Two or More Races
- Education Classification
- Economic Status
- English Learner (EL)
- Migrant Status

For the purposes of this report, participation rate is defined as the percentage of students who received a valid scale score given the total number of students who were expected to take the online test or receive a test book. These participation rates are summarized in Table 7.1. Both the percentage of students classified as reportable and the number of students classified as accountable are reported. Reportable students include all students with a valid scale score. The "Accountable" columns shows the total numbers of students who were expected to take the online test or receive a test book. These include students who should have received a LEAP 2025 scale score but who did not take the test and could not be assigned a scale score.

## Table 7.1 Participation Rates

| Participation Rates by Grade and Subgroup |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Grade | Group | $\begin{gathered} \text { Accountable } \\ \text { in } \\ \text { ELA } \end{gathered}$ | Percentage Reportable in ELA | Accountable in Mathematics | Percentage Reportable in Mathematics |
| 3 | All Students | 250,130 | 98.75\% | $\geq 50,540$ | 98.79\% |
|  | Gender |  |  |  |  |
|  | Female | $\geq 24,530$ | 98.79\% | $\geq 24,690$ | 98.82\% |
|  | Male | $\geq 25,560$ | 98.74\% | $\geq 25,760$ | 98.79\% |
|  | Ethnicity |  |  |  |  |
|  | Hispanic/Latino | $\geq 4,620$ | 98.90\% | 24,670 | 98.95\% |
|  | American Indian or Alaska Native | $\geq 280$ | 98.96\% | $\geq 290$ | 99.32\% |
|  | Asian | $\geq 820$ | 99.15\% | $\geq 820$ | 99.15\% |
|  | Black or African American | $\geq 21,370$ | 98.54\% | $\geq 21,530$ | 98.60\% |
|  | Native Hawaiian or Other Pacific | $\geq 40$ | 97.78\% | $\geq 40$ | 97.87\% |
|  | White | $\geq 21,240$ | 98.97\% | $\geq 21,360$ | 98.98\% |
|  | Two or More Races | $\geq 1,680$ | 98.39\% | $\geq 1,690$ | 98.46\% |
|  | Education Classification |  |  |  |  |
|  | Regular | $\geq 43,820$ | 98.83\% | $\geq 44,190$ | 98.86\% |
|  | Special | $\geq 6,300$ | 98.19\% | $\geq 6,350$ | 98.27\% |
|  | Economic Status |  |  |  |  |
|  | Economically Disadvantaged | $\geq 37,140$ | 98.68\% | $\geq 37,380$ | 98.73\% |
|  | Not Economically Disadvantaged | $\geq 12,980$ | 98.98\% | $\geq 13,160$ | 98.94\% |
|  | English Learner Status |  |  |  |  |
|  | Not English Learner | $\geq 47,920$ | 98.74\% | $\geq 48,310$ | 98.76\% |
|  | English Learner | $\geq 2,200$ | 99.09\% | $\geq 2,230$ | 99.24\% |
|  | Migrant Status |  |  |  |  |
|  | Not Migrant | $\geq 46,770$ | 98.73\% | $\geq 47,170$ | 98.75\% |
|  | Migrant | $\geq 3,350$ | 99.14\% | $\geq 3,370$ | 99.23\% |

*Students in grade 8 who enrolled in Algebra I had the option of taking the Algebra LEAP 2025 HS test instead of the LEAP 2025 Mathematics grade 8 test.

### 7.1 Current Administration Data

Tables 7.2 through 7.13 show the percentage of students in each achievement level based on the state population for the 2021 administration of the ELA and mathematics assessments. Results from previous years are presented as well for comparison purposes.

Table 7.2 Comparison of Percentage of Students in Achievement Levels: ELA Grade 3

| Year | N | Unsatisfactory | Approaching <br> Basic | Basic | Mastery | Advanced |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2017 | $\geq 56,800$ | 13.4 | 17.8 | 24.7 | 38.9 | 5.1 |

| 2018 | $\geq 44,910$ | 20.9 | 27.4 | 23.7 | 26.1 | 1.9 |
| 2019 | $\geq 44,520$ | 20.9 | 25.7 | 25.4 | 25.7 | 2.3 |
| 2021 | $\geq 45,840$ | 27.3 | 25.8 | 25.2 | 20.2 | 1.5 |

Score reports are the primary means of communicating test scores to appropriate school system personnel (e.g., testing coordinators or superintendents), teachers, and parents. Standard 6.10 of the Standards states:

When test score information is released, those responsible for testing programs should provide interpretations appropriate to the audience. The interpretations should describe in simple language what the test covers, what scores represent, the precision/reliability of the scores, and how scores are intended to be used (119).

Standard 5.1 is related to Standard 6.10. It states:
Test users should be provided with clear explanations of the characteristics, meaning, and intended interpretation of scale scores, as well as their limitations (102).

Interpretations of test scores are disseminated in two ways: the individual score report and the LEAP 2025 Interpretive Guide (2021).

In addition to providing interpretationof the test results, the LODE and DRC must ensure that the information is understandable for the target audience. Standard 7.0 states:

Information relating to tests should be clearly documented so that those who use tests can make informed decisions regarding which test to use for a specific purpose, how to administer the chosen test, and how to interpret test scores (125).

The LDOE and DRC strive to create documents that will be accessible to parents, teachers, and all other stakeholders.

The Individual Student-Level Report (ISR) is the primary means for sharing student test results with parents. As such, it is a stand-alone document from which parents can glean information that is relevant to understanding their children's test scores. For more information about the test, parents are provided $\underline{A}$ Parent Guide to the LEAP 2025 Student Reports. In the 2021 administration year, student reports for each school were posted by grade, then downloaded and printed from eDIRECT by school systems and schools. eDIRECT is DRC's secure online system that provides schools and districts access to student tests and reports.

### 7.1.1 Description of Each Type of Report

In this section, descriptions of the School Roster Report and the ISR are provided.
In compliance with AERA, APA, \& NCME (2014) Standard 12.18, the LEAP 2025 score reports provide clear information about the results of individual students and of specific groups of students. Standard 12.18 states:

In educational settings, score reports should be accompanied by a clear presentation of information on how to interpret the scores, including the degree of measurement error associated with each score or classification level, and by supplementary information related to group summary scores. In addition, dates of test administration and relevant norming studies should be included in score reports (200).

## School Roster Report

A School Roster Report, which provides summary information about student performance on the LEAP 2025 ELA and Mathematics tests, is available to school systems and schools through eDIRECT. Total test scores and achievement-level indicators are shown for the content area of interest. Reporting category and subcategory performance ratings are also reported for students. At the school level, the percentage of students at each achievement level and rating by category and subcategory are summarized. More details can be found in the LEAP 2025 Interpretive Guide.

## Individual Student-Level Report

The ISR is another type of report available through the eDIRECT system. ISRs may be downloaded and printed by schools to be sent home to parents. At the top of the page, overall student performance is reported by scale scores and achievement level. To give context to the student score, the student's school system and state averages are presented to the right of the student information. In the middle of the page, category and
subcategory performance indicators are reported. achievement-level descriptors and the percentage of students in each achievement level by school, school system, and the state, which allows comparisons of the student's overall achievement level to those of their peers, are found at the bottom of the page. When a student does not receive a scale score, their achievement level will be left blank. ISRs for students whose scores were invalidated will display a blank scale score for a given content area.

A data file referred to as Louisiana Department of Education Student File (LDESTD) was provided to the LDOE by DRC. It contains one record for every student tested; each record contains demographic information, responses for multiple-choice ( MC ) items, scores for items that are not MC items, raw scores, content and process standard raw scores, scale scores, and performance-level data for each content area.

The LEAP 2025 Interpretive Guide was written to help Louisiana school system and school administrators, teachers, parents, and the general public to better understand the LEAP 2025 ELA and mathematics tests. The LEAP 2025 Interpretive Guide was developed collaboratively by DRC and LDOE staff. LDOE staff had opportunities to review the guide, provide feedback, and give final approval.

The LEAP 2025 Interpretive Guide has three sections. The first section presents an introduction and an overview of key terms and test-related concepts. The second section discusses assessment terms and types of scores that are presented on the ISRs. Sample ISRs are included in the guide. The third section discusses information that is presented on the School Roster Report and an example of the report.

In summary, the overall purpose of reporting test results is to communicate information on student performance to stakeholders. These results are presented in the context of score reports that aid the user in understanding the meaning of the test scores. The reports and ancillary information developed by DRC address multiple best practices of the testing industry but are particularly related to the following standards:

Standard 5.1 Test users should be provided with clear explanations of the characteristics, meaning, and intended interpretation of scale scores, as well as their limitations (102).

Standard 6.10 When test score information is released, those responsible for testing programs should provide interpretations appropriate to the audience. The interpretations should describe in simple language what the test covers, what scores represent, the precision/reliability of the scores, and how scores are intended to be used (119).

Standard 7.0 Information relating to tests should be clearly documented so that those who use tests can make informed decisions regarding which test to use for a specific purpose, how to administer the chosen test, and how to interpret test scores (125).

Standard 12.18 In educational settings, score reports should be accompanied by a clear presentation of information on how to interpret the scores, including the degree of measurement error associated with each score or classification level, and by supplementary information related to group summary scores. In addition, dates of test administration and relevant norming studies should be included in score reports (200).

## Chapter 8: Performance-Level Setting

This chapter briefly describes the LEAP 2025 performance-level setting and presents the cut scores and achievement-level descriptors derived from the performance-level setting. Since the LDOE uses PARCC cut scores for the LEAP 2025 ELA and mathematics tests, a brief overview of the PARCC performance-level setting procedures is included in this chapter. A more detailed discussion and the results of the PARCC performancelevel setting may be found in the Performance Level Setting Technical Report (Pearson, 2015).

The AERA, APA, \& NCME (2014) Standards addressed by the Performance Level Setting Technical Report (Pearson, 2015) are 5.21 and 5.22.

Starting in the spring of 2015, the ELA and mathematics assessments measured different content and constructs than did previous tests were administered to Louisiana students. The new tests were built using the PARCC item bank and were fully aligned to the Louisiana Student Standards. The new tests were reported on new scales, and students were classified by achievement levels based on their knowledge and ability to perform different tasks in relation to the new test content and standards.

In terms of the validity of the LEAP 2025 test scores, it is essential to understand that descriptors and cut scores are established in a collaborative and participatory process. The descriptors clearly establish, in plain language, the proper frame of reference for understanding how to interpret test scores, particularly cut scores.

### 8.1 PARCC Performance-Level Setting Process for English Language Arts and Mathematics

According to the Performance Level Setting Technical Report (Pearson, 2015), PARCC used the evidencebased standard setting (EBSS) method (Beimers, Way, McClarty, \& Miles, 2012) for the PARCC performancelevel setting (PLS) process. The EBSS method is used to combine various considerations into the process for setting performance levels, including policy considerations, content standards, research, and educator judgment about what students should know and be able to demonstrate, and to support PARCC's policy goals related to college- and career-readiness expectations. Additional details about the EBSS method can be found in the Performance Level Setting Technical Report (Pearson, 2015).

### 8.2 Cut Scores

This section presents the cut scores for each grade and content area of the LEAP 2025. Tables 8.1 and 8.2 show the ELA and mathematics cut scores for students in grades 3 through 8 .

Table 8.1 English Language Arts Cut Scores

| Grade | Cut Scores |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Approaching <br> Basic | Basic | Mastery | Advanced |
| 3 | 700 | 725 | 750 | 810 |
| 4 | 700 | 725 | 750 | 790 |
| 5 | 700 | 725 | 750 | 799 |
| 6 | 700 | 725 | 750 | 790 |
| 7 | 700 | 725 | 750 | 785 |
| 8 | 700 | 725 | 750 | 794 |

## Table 8.2 Mathematics Cut Scores

| Grade | Cut Scores |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Approaching <br> Basic | Basic | Mastery | Advanced |
| 3 | 700 | 725 | 750 | 790 |
| 4 | 700 | 725 | 750 | 796 |
| 5 | 700 | 725 | 750 | 790 |
| 6 | 700 | 725 | 750 | 788 |
| 7 | 700 | 725 | 750 | 786 |
| 8 | 700 | 725 | 750 | 801 |

### 8.2.1 Reporting Category Cut Scores

As stated in Section 6.4.2.3, student performance on ELA and mathematics reporting categories and subcategories was classified into one of three performance ratings: Strong, Moderate, and Weak. Detailed rules for calculating performance ratings for ELA and mathematics reporting categories and subcategories can be found in that section.

The cut scores divide the continuum of student achievement into the following five achievement levels used by the LDOE for reporting purposes:

- Advanced: Students performing at this level have exceeded college- and career-readiness expectations and are well prepared for the next level of study in this content area.
- Mastery: Students performing at this level have met college- and career-readiness expectations and are prepared for the next level of study in this content area.
- Basic: Students performing at this level have nearly met college- and career-readiness expectations and may need additional support to be fully prepared for the next level of study in this content area.
- Approaching Basic: Students performing at this level have partially met college- and careerreadiness expectations and will need much support to be prepared for the next level of study in this content area.
- Unsatisfactory: Students performing at this level have not yet met the college- and careerreadiness expectations and will need extensive support to be prepared for the next level of study in this content area.

Table 8.3 summarizes the LEAP 2025 ELA and mathematics scale score ranges for each level of achievement.

Table 8.3 Achievement-Level Scale Score Ranges

| ELA |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Achievement Level | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 |
| Advanced | 810-850 | 790-850 | 799-850 | 790-850 | 785-850 | 794-850 |
| Mastery | 750-809 | 750-789 | 750-798 | 750-789 | 750-784 | 750-793 |
| Basic | 725-749 |  |  |  |  |  |
| Approaching Basic | 700-724 |  |  |  |  |  |
| Unsatisfactory | 650-699 |  |  |  |  |  |
| MATHEMATICS |  |  |  |  |  |  |
| Achievement Level | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade 8 |
| Advanced | 790-850 | 796-850 | 790-850 | 788-850 | 786-850 | 801-850 |
| Mastery | 750-789 | 750-795 | 750-789 | 750-787 | 750-785 | 750-800 |
| Basic | 725-749 |  |  |  |  |  |
| Approaching Basic | 700-724 |  |  |  |  |  |
| Unsatisfactory | 650-699 |  |  |  |  |  |

This chapter presented a brief overview of PARCC's performance-level setting process, which set the cut scores used by the LDOE for reporting student performance on the LEAP 2025 ELA and mathematics tests. These procedures are addressed in more detail in relevant technical reports.

The performance-level setting process undertaken by PARCC addresses the following standards:
Standard 5.21 When proposed score interpretations involve one or more cut scores, the rationale and procedures used for establishing cut scores should be documented clearly (107).

Standard 5.22 When cut scores defining pass-fail or proficiency levels are based on direct judgments about the adequacy of item or test performances, the judgmental process should be designed so that the participants providing the judgments can bring their knowledge and experience to bear in a reasonable way (108).

## Chapter 9: Evidence of Validity

Evidence for validity-the meaning of test scores and the inferences they support-is the central concept underlying the LEAP 2025 validation process. Validity evidence, from the design of the test to item development and scoring, is created throughout the entire assessment process. Therefore, evidence of validity is described throughout the LEAP 2025 technical report. Table 9.1 summarizes the sources of evidence of validity and indicates where the evidence can be found in the technical report.

Table 9.1 Summary of Evidence of Validity and the Report Chapter in Which it is Found

| Source of Validity | Related Information | Related Chapter/Source |
| :---: | :---: | :---: |
| Evidence Based on Test Content | Item Development Process | Chapter 3 <br> 2020-2021 LEAP Grades 3-8 ELA and Mathematics Assessment Frameworks |
|  | Test Blueprint and Item Alignment to Curriculum and Standards | Chapter 3 <br> 2020-2021 LEAP Grades 3-8 ELA and Mathematics Assessment Frameworks |
|  | Item Bias, Sensitivity, and Content Appropriateness | Chapter 3 |
|  | Accommodations | Chapters 3 and 4 |
| Evidence Based on Response Processes | Data Review | 2020-2021 LEAP Grades 3-8 ELA and Mathematics Assessment Frameworks |
|  | Classical Item analysis | Chapter 6 |
| Evidence Based on Internal Structure | Differential Item Functioning | Chapter 10 |
|  | Reliability and Standard Errors of Measurement | Chapter 9 |
| Evidence Based on Relationships to Other Variables | Divergent Validity | Chapter 9 |
|  | Regression of LEAP 2025 from 2019 to 2021 | Chapter 9 |
| Evidence Based on the Consequences of Testing | Scale Score and Performance Level Information | Chapter 7 |
|  | Test Interpretive Guide | Chapter 4 |

In this chapter, DRC presents evidence of construct-related validity through studies of test reliability, convergent validity, and divergent validity. All analyses in this chapter are based on census data.

Chapter 9 of this report demonstrates adherence to the American Educational Research Association, American Psychological Association, \& National Council on Measurement in Education (AERA, APA, \& NCME, 2014) Standards $1.13,1.21,2.0,2.3,2.13,2.14,2.16$, and 2.19 . Each standard is discussed in the pertinent section of this chapter.

### 9.1 Construct-Irrelevant Variance and Construct Underrepresentation

Minimization of construct-irrelevant variance and construct underrepresentation is addressed in the following steps of the test development process: (1) specification, (2) item writing, (3) review, (4) field testing, (5) test construction, and (6) item calibration (see Chapter 3 for more information on steps 1-5 and Chapter 6 for more information on step 6).

Construct-irrelevant variance refers to error variance that is caused by factors unrelated to the constructs measured by the test. For example, when tests are not administered under standardized conditions (e.g., one administration may be timed, but another administration is untimed), differences in student performance related to different administration conditions may result. Careful specification of content and review of the items representing that content are first steps in minimizing construct-irrelevant variance. Then, empirical evidence, especially item-level data, is used to infer construct irrelevance.

Construct underrepresentation occurs when the content of the assessment does not reflect the full range of content that the assessment is expected to cover. Specification and review, a process through which test blueprints are developed and reviewed, are primary steps in the development process designed to ensure that content is appropriately represented.

### 9.2 Reliability

Reliability refers to the consistency of students' test scores on parallel forms of a test. A reliable test is one that produces scores that are expected to be relatively stable if the test is administered repeatedly under similar conditions. Often, however, it is impractical to administer multiple forms of the test, and reliability is estimated on a single administration of the test. This type of reliability, known as internal consistency, provides an estimate of how consistently examinees perform across items within a test during a single test administration (Crocker \& Algina, 1986). Reliability is a necessary, but not sufficient, condition of validity.

The 2014 Standards indicates the following:
The term reliability has been used in two ways in the measurement literature. First, the term has been used to refer to the reliability coefficients of classical test theory, defined as the correlation between scores on two equivalent forms of the test, presuming that taking one form has no effect on performance on the second form. Second, the term has been used in a more general sense, to refer to the consistency of scores across replications of a testing procedure, regardless of how this consistency is estimated or reported (e.g., in terms of standard errors, reliability coefficients per se, generalizability coefficients, error/tolerance ratios, item response theory (IRT) information functions, or various indices of classification consistency) (33).

In accordance with the Standards in developing and maintaining tests of the highest quality, DRC has calculated the reliability of each LEAP 2025 test in a variety of ways: reliability of raw scores, overall standard error of measurement (SEM), IRT-based conditional SEM, and decision consistency of achievement-level classifications.

There are several specific standards that this chapter addresses. These include Standards 2.0, 2.3, 2.13, and 2.19, each of which is articulated below.

Standard 2.0 Appropriate evidence of reliability/precision should be provided for the interpretation for each intended score use (42).

Standard 2.3 For each total score, subscore, or combination of scores that is to be interpreted, estimates of relevant indices of reliability/precision should be reported (43).

The total score reliabilities are discussed in Section 9.2.1 of this chapter. The SEMs and subscore reliabilities are presented in Sections 9.4.2 and 9.4.3. The SEM of the total score is discussed in Section 9.2.2.

Standard 2.13 The standard error of measurement, both overall and conditional (if reported), should be provided in units of each reported score (45).

The SEM based on raw scores is discussed in Section 9.2.2 and is reported in raw score units. The conditional SEM is discussed in Section 9.2.3 and is presented in scale score units.

Standard 2.19 Each method of quantifying the reliability/precision of scores should be described clearly and expressed in terms of statistics appropriate to the method. The sampling procedures used to select test takers for reliability/precision analyses and the descriptive statistics on these samples, subject to privacy obligations where applicable, should be reported (47).

Section 9.2 discusses different ways of measuring test reliability, including reliability of raw scores and testform SEM, IRT-based conditional SEM, and decision consistency of achievement-level classifications. These statistics were computed based on the census data.

### 9.2.1 Test Reliability

The reliability of raw scores by test form was evaluated using Cronbach's (1951) coefficient alpha, which is a lower-bound estimate of test reliability. The reliability coefficient is a ratio of the variance of true test scores to the variance of the total observed scores, with the values ranging from 0 to 1 . The closer the value of the reliability coefficient is to 1 , the more consistent the scores, where 1 refers to a perfectly consistent test. In general, reliability coefficients that are equal to or greater than 0.8 are considered acceptable for tests of moderate lengths.

Cronbach's coefficient alpha was computed using the formula

$$
\begin{equation*}
\alpha=\frac{n}{n-1}\left[1-\frac{\sum_{i=1}^{n} \sigma_{i}^{2}}{\sigma_{X}^{2}}\right] \tag{9.1}
\end{equation*}
$$

where $n$ is the number of items on the test, ${ }^{2}$ is the variance of item $i$, and $\sigma_{x}^{2}$ is the variance of the total test score.

Total test reliability measures, such as Cronbach's coefficient alpha and SEM, consider the consistency (i.e., reliability) of performance over all test questions in a given form, the results of which imply how well the questions measure the content domain and could continue to do so over repeated administrations. The number of items in the test influences these statistics;for example, a longer test can be expected to be more reliable than a shorter test.

The reliability coefficients for the LEAP 2025 are reported in Table 9.2. These reliability coefficients were computed using the census data. The reliability statistics ranged from 0.87 to 0.92 for all ELA forms. The ELA forms have one writing component ( RI or RL ) that is the same score of another component (WE); the item score for the RI/RL component was excluded from the reliability computation. For mathematics, the reliabilities ranged from 0.91 to 0.94 . These results indicate acceptable reliability coefficients for the LEAP 2025 tests.

Table 9.2 Reliability in English Language Arts and Mathematics

| Content | Grade | Mode | Number <br> of Items | Number of <br> Score Points | SEM | Cronbach's <br> Alpha | N- <br> Count |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ELA | 3 | CBT | 26 | 71 | 4.21 | 0.88 | $\geq 12,090$ |
| ELA | 3 | PBT | 26 | 71 | 4.58 | 0.87 | $\geq 37,540$ |
| ELA | 4 | CBT | 28 | 86 | 4.97 | 0.90 | $\geq 16,480$ |
| ELA | 4 | PBT | 28 | 86 | 5.39 | 0.89 | $\geq 33,070$ |
| ELA | 5 | CBT | 28 | 86 | 4.97 | 0.90 | $\geq 49,780$ |
| ELA | 6 | CBT | 32 | 90 | 5.20 | 0.91 | $\geq 51,430$ |
| ELA | 7 | CBT | 32 | 90 | 5.60 | 0.92 | $\geq 52,180$ |
| ELA | 8 | CBT | 32 | 94 | 5.71 | 0.90 | $\geq 51,680$ |
| Mathematics | 3 | CBT | 43 | 62 | 3.47 | 0.93 | $\geq 12,070$ |
| Mathematics | 3 | PBT | 43 | 62 | 3.72 | 0.93 | $\geq 37,520$ |
| Mathematics | 4 | CBT | 42 | 61 | 3.35 | 0.94 | $\geq 16,430$ |
| Mathematics | 4 | PBT | 42 | 61 | 3.53 | 0.94 | $\geq 33,050$ |
| Mathematics | 5 | CBT | 38 | 56 | 3.33 | 0.93 | $\geq 49,700$ |
| Mathematics | 6 | CBT | 40 | 63 | 3.46 | 0.94 | $\geq 51,340$ |
| Mathematics | 7 | CBT | 43 | 66 | 3.80 | 0.92 | $\geq 52,080$ |
| Mathematics | 8 | CBT | 37 | 60 | 3.23 | 0.91 | $\geq 45,840$ |

The reliability statistics by subgroup are reported and discussed in Chapter 10.

### 9.2.2 Standard Error of Measurement

The reliability of reported test scores can be characterized by the standard errors associated with the scores. The SEM may be used to determine the range within which a student's true score is likely to fall. An observed score should be regarded not as a student's true score but as an estimate of a student's true score. It is expected that the score a student obtains from a single test administration would fall within one SEM of the student's true score $68 \%$ of the time and within approximately two SEMs of the true score $95 \%$ of the time. The SEM is an index of the random variability in test scores and is defined as follows:

$$
\begin{equation*}
\mathrm{SEM}=S D \sqrt{1-R_{x x^{\prime}}} \tag{9.2}
\end{equation*}
$$

where SD represents standard deviation of the raw score distribution, and $R_{x x}$, is estimated by $\hat{\alpha}$ as expressed in Equation 9.1.

The SEM at the test-form level was computed in raw score metric and is also presented in Table 9.2 for ELA and mathematics.

### 9.2.3 Conditional Standard Error of Measurement

In contrast to SEM, conditional standard error of measurement (CSEM) expresses the degree of measurement error in scale score units and is conditioned on the ability of the student. DRC reports the CSEM in support of Standard 2.14, which states:

When possible and appropriate, conditional standard errors of measurement should be reported at several score levels unless there is evidence that the standard error is constant across score levels. Where cut scores are specified for selection or classification, the standard errors of measurement should be reported in the vicinity of each cut score (46).

In further compliance with Standard 2.14, the CSEM of each cut score is reported in Table 9.3.
The CSEMs are defined as the reciprocal of the square root of the test information function and can be estimated across all points of the ability continuum (Hambleton \& Swaminathan, 1985). The CSEM is defined in the following equation:

$$
\begin{equation*}
\operatorname{CsEM}\left(\theta_{i}\right)=\frac{1}{\sqrt{I\left(\theta_{i}\right)}} \tag{9.3}
\end{equation*}
$$

where $l\left(\vartheta_{i}\right)$ is the test information function, as a sum of item information function 2 , obtained as

$$
\begin{equation*}
I\left(\theta_{i}\right)=\sum_{j} \frac{p_{i j}^{\prime}\left(\theta_{i}\right)^{2}}{p_{i j}\left(\theta_{i}\right) q_{i j}\left(\theta_{i}\right)} \tag{9.4}
\end{equation*}
$$

where $p_{i j}^{\prime}\left(\theta_{i}\right)$ is the derivative of $p_{i j}\left(\theta_{i}\right)$ and $q_{i j}\left(\theta_{i}\right)=1-p_{i j}\left(\theta_{i}\right)$.
Note that the CSEMs vary in magnitude across the entire range of student ability estimates (i.e., scale scores) and are smaller in the middle of the score distribution and higher at the tails. This pattern is expected when IRT methods are used. Since LEAP 2025 was first administered, every effort has been made to make the TCC and CSEM values at the cut scores between the PARCC assessments and the LEAP 2025 assessments similar. Both TCC and CSEM values have been similar across the LEAP 2025 alternate forms given the same content because similar or the same statistical properties are important for alternate forms. To provide context regarding the magnitude of the CSEMs, it is important to also refer to sections 9.2.1 Test Reliability and 9.2.4 Classification Accuracy and Consistency where evidence is provided of high measures of form reliability and levels of accurate student classification at the cutpoints to support the use of the LEAP 2025 assessments. The CSEMs at the four cut scores that define the performance levels are presented in Table 9.3.

Table 9.3 Conditional Standard Errors of Measurement at the Approaching Basic, Basic, Mastery, and Advanced Cut Scores

| Content Area | Grade | Mode | Approaching Basic |  | Basic |  | Mastery |  | Advanced |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Cut Score | CSEM | Cut Score | CSEM | Cut Score | CSEM | Cut Score | CSEM |
| ELA | 3 | CBT | 700 | 14 | 725 | 12 | 750 | 11 | 810 | 13 |
| ELA | 3 | PBT | 700 | 13 | 725 | 12 | 750 | 11 | 810 | 12 |
| ELA | 4 | CBT | 700 | 10 | 725 | 8 | 750 | 8 | 790 | 9 |
| ELA | 4 | PBT | 700 | 10 | 725 | 8 | 750 | 7 | 790 | 8 |
| ELA | 5 | CBT | 700 | 11 | 725 | 8 | 750 | 7 | 799 | 8 |
| ELA | 6 | CBT | 700 | 9 | 725 | 7 | 750 | 7 | 790 | 8 |
| ELA | 7 | CBT | 700 | 9 | 725 | 7 | 750 | 7 | 785 | 8 |
| ELA | 8 | CBT | 700 | 10 | 725 | 8 | 750 | 8 | 794 | 8 |
| Mathematics | 3 | CBT | 700 | 9 | 725 | 7 | 750 | 7 | 790 | 10 |
| Mathematics | 3 | PBT | 700 | 9 | 725 | 7 | 750 | 7 | 790 | 10 |
| Mathematics | 4 | CBT | 700 | 9 | 725 | 7 | 750 | 7 | 796 | 10 |
| Mathematics | 4 | PBT | 700 | 9 | 725 | 7 | 750 | 7 | 796 | 10 |
| Mathematics | 5 | CBT | 700 | 9 | 725 | 7 | 750 | 7 | 790 | 9 |
| Mathematics | 6 | CBT | 700 | 9 | 725 | 7 | 750 | 6 | 788 | 8 |
| Mathematics | 7 | CBT | 700 | 9 | 725 | 7 | 750 | 6 | 786 | 8 |
| Mathematics | 8 | CBT | 700 | 11 | 725 | 9 | 750 | 7 | 801 | 10 |

Figures 9.1 and 9.2 display the CSEM (conditional standard error of measurement) curves for each grade and content area by mode. Typically, with fixed-form assessments, the estimates of measurement error tend to be higher at the low and high ends of the scale-score range where few items measure those ability levels. Generally, there are few students with extreme scores, and these score levels cannot be estimated as accurately as levels toward the middle of the ability range. The middle ability range, where cut scores are located, shows lower measurement error than the low and high ends of the ability ranges. Figures 9.1 and 9.2 demonstrate that the tests are designed so that measurement error is minimized in the middle of the scale range, where most students are located.

### 9.2.4 Classification Accuracy and Consistency

## Classification Accuracy

Classification accuracy is defined as the extent to which the actual classifications of test takers into various achievement levels match classifications made based on their true scores (Livingston \& Lewis, 1995). Classification accuracy refers to the agreement between the observed score and the true score, whereas classification consistency refers to the agreement between two observed scores.

## Classification Consistency

Classification consistency is defined as the extent to which the classifications of students in a particular achievement level match based on two independent administrations of the same test form or one administration of two parallel test forms. It is often logistically infeasible, as well as expensive, to obtain data from repeated administrations of a test, be it re-administration of the same test or administration of a parallel form. Therefore, a common practice is to estimate classification consistency from one administration of a test.

The Livingston-Lewis (1995) methodology was used to calculate classification accuracy statistics based on the spring 2021 LEAP 2025 results. The Livingston-Lewis procedure utilizes a beta-binomial model that requires two steps: (1) fitting proportion-correct true scores to a four-parameter beta distribution and (2) using the binomial distribution to estimate classification accuracy and consistency. All calculations for classification accuracy and consistency are based on census data.

Classification consistency and classification accuracy conditioned on achievement level (see Table 9.4 and Table 9.5) and on cut score (see Table 9.6 and Table 9.7) are presented for the 2021 LEAP 2025 in this section of the report. The magnitude of classification consistency and accuracy measures is influenced by several key features of the test design, including the number of items, the location and number of cut scores, the score distribution, and the reliability and associated SEM. As can be seen in Table 9.4, classification accuracy conditioned on achievement level ranged from 0.53 to 0.84 for ELA and 0.22 to 0.88 for mathematics. Classification consistency (see Table 9.5) conditioned on achievement level ranged from 0.43 to 0.75 for ELA and 0.35 to 0.82 for mathematics. Table 9.6 shows that classification accuracy at achievement cut points ranged from 0.89 to 0.97 for ELA and 0.88 to 0.99 for mathematics. Classification consistency (see Table 9.7) conditioned at achievement cut points ranged from 0.85 to 0.97 for ELA and 0.84 to 0.99 for mathematics. Classification consistency and accuracy at achievement cut points tend to be higher values than those conditioned on achievement level. For some tests, classification accuracy and consistency conditioned on the Advanced level were lower than 0.50 . One reason for these relatively low Advanced level values is few highly difficult items to distinguish the Advanced level from other achievement levels.

Table 9.4 Classification Accuracy Conditioned on Level of Achievement

|  | Classification Accuracy |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Content <br> Area | Grade | Mode | Unsatisfactory | Approaching <br> Basic | Basic | Mastery | Advanced |  |
| ELA | 3 | CBT | 0.80 | 0.58 | 0.63 | 0.77 | 0.53 |  |
| ELA | 3 | PBT | 0.71 | 0.57 | 0.59 | 0.82 | 0.57 |  |
| ELA | 4 | CBT | 0.77 | 0.68 | 0.69 | 0.78 | 0.66 |  |
| ELA | 4 | PBT | 0.68 | 0.62 | 0.71 | 0.79 | 0.69 |  |
| ELA | 5 | CBT | 0.61 | 0.64 | 0.71 | 0.84 | 0.58 |  |

| Mathematics | 8 | CBT | 0.72 | 0.47 | 0.59 | 0.78 | 0.62 |  |  |

Perhaps the most important indices for accountability systems are those for the accuracy and consistency of classification decisions made at specific cut points. To evaluate decisions at specific cut points, the joint distribution of all the achievement levels is collapsed into a dichotomized distribution around that specific cut point. As an example, for the LEAP 2025 assessments, a dichotomization at the cut point between the Basic and Mastery classifications was formed. The proportion of correct classifications below this particular cut point is equal to the sum of all the cells at the Unsatisfactory, Approaching Basic, and Basic levels, and the proportion of correct classifications above that particular cut point is equal to the sum of all the cells at the Mastery and Advanced levels. Table 9.6 shows the classification accuracy and Table 9.7 shows the consistency estimates when conditioned on LEAP 2025 cut scores. The classification accuracy statistics are at or above 0.88 , while the classification consistency statistics are at or above 0.84 . These results suggest that consistent and accurate achievement-level classifications are being made for students in Louisiana based on the LEAP 2025.

Table 9.6 Classification Accuracy at Achievement Cut Points

|  | Classification Accuracy |  |  |  |  |  |

### 9.2.5 Convergent Validity

Convergent validity is a subtype of construct validity that can be estimated by the extent to which measures of constructs that theoretically should be related to each other are, in fact, observed as related to each other. Analyses of the internal structure of a test can indicate the extent to which the relationships among test items conform to the construct the test purports to measure. For example, the LEAP 2025 mathematics test is designed to measure a single overall construct-mathematics achievement; therefore, the items comprising the LEAP 2025 mathematics test should measure only mathematics, not language or reading.

This technical report summarizes additional statistics that contribute to construct validity (Cronbach's coefficient alpha is reported previously in this section, and item fit is reported in Chapter 6). The internal consistency coefficient (i.e., Cronbach's alpha) reported is typically measured via correlations among the test items and indicates of the degree of the same general construct (Pearson, 2015, page 128). Table 9.2 shows test reliability statistics for ELA and mathematics. The reliability statistics ranged from 0.87 to 0.92 for ELA forms and from 0.91 to 0.94 for mathematics forms, indicating that items on the 2021 LEAP 2025 assessments are homogenous. For a group of items to be homogeneous, the items must measure the same construct (i.e., construct validity) or represent the same content domain (i.e., content validity). Because IRT models were used to calibrate test items and to report student scores, item fit is also relevant to construct validity. The extent to which test items function as the IRT model prescribes is relevant to the validation of test scores. As shown in Chapter 6, no items were flagged for poor model/data fit.

### 9.3 Principal Components Analysis

As another measure of construct validity, DRC examined the unidimensionality of each grade-level LEAP 2025 test. One of the underlying assumptions of the IRT models used to scale the LEAP 2025 tests is that the tests being calibrated are unidimensional; that is, items in each grade and content area measure a single content domain. For example, mathematics items should measure mathematics ability and not reading skills. Standard 1.13 of the Standards states:

If the rationale for a test score interpretation for a given use depends on premises about the relationships among test items or among parts of the test, evidence concerning the internal structure of the test should be provided (26-27).

This section examines the internal structure of the LEAP 2025 tests by evaluating the unidimensionality assumption through principal components analysis (PCA). This analysis seeks evidence that there exists a single primary factor, the first principal component, which accounts for much of the relationship between items. The presence of a single or dominant factor suggests that a test is sufficiently unidimensional (i.e., that it measures one underlying construct).

A PCA was conducted for each grade, content area, and mode of the LEAP 2025 assessments. A large first principal component is evident in each analysis. It is common to have additional eigenvalues greater than 1.0, which may suggest the presence of other factors.

For all grades, content areas, and modes of the LEAP 2025 assessments, the ratio of variance accounted for by the first factor to variance accounted for by the second is sufficiently large to indicate that the unidimensionality assumption holds. All the LEAP 2025 content-area tests exhibit first principal components accounting for more than $20 \%$ of the test variance for ELA (see Table 9.8) and for mathematics (see Table 9.9). To further investigate the unidimensionality of the ELA and mathematics assessments, the ratio of the first eigenvalue to the second eigenvalue was found (see Tables 9.8 and 9.9 ). These ratios show that the first eigenvalue is at least four times as large as the second eigenvalue for all the grades, content areas, and modes. This substantial difference in magnitude indicates that one factor appears to be dominant and that the ELA and mathematics tests are essentially unidimensional.

This evidence supports the claim that there is a dominant dimension underlying the items and tasks in each test and that scores from each test represent performance primarily determined by that ability. Constructirrelevant variance, such as factual knowledge irrelevant to doing well in a subject, does not appear to create significant nuisance factors.

Table 9.8 Principal Component Analysis for English Language Arts

| Grade | Mode | Components | Eigenvalue | Percentage of Variance Explained | Cumulative Percentage of Variance Explained |
| :---: | :---: | :---: | :---: | :---: | :---: |

### 9.4 Analyses by Reporting Categories and Subcategories

Three sets of analyses were conducted at the reporting category and subcategory levels for ELA and mathematics in another attempt to assess the construct validity of the LEAP 2025 assessments. First, correlation coefficients that measure the relationship between the reporting category scores and subcategory scores in both subjects were computed. Second, the reliability of each reporting category and subcategory was computed. Finally, the SEM was computed for each reportable category and subcategory.

### 9.4.1 Correlations among Reporting Categories and Subcategories

This section reports the strength of the interrelationships among the categories or subcategories by computing the correlation between them. Tables 9.10-9.13 report the uncorrected Pearson product-moment (PPM) correlation coefficients, the PPM corrected for attenuation (CAPPM), and the reliability coefficients described above. The PPM among the categories and subcategories is presented below the diagonal portion
of the matrix, the CAPPM is presented above the diagonal portion of the matrix, and the reliability coefficients used are shown in Tables 9.10-9.13.

The uncorrected PPM in Tables 9.10-9.13 should be interpreted in the context of the reliability coefficient. In general, lower PPM coefficients are expected between variables that are less reliable. In most cases, the PPM coefficients show that performance on one category or subcategory is moderately to strongly related to performance on another category or subcategory within the same grade and content area. The value of the correlation coefficients will be affected by the limited number of items measuring each category or subcategory. Therefore, caution should be used when comparing the PPM coefficients that measure the relationships between categories or subcategories to those that measure the relationships between content areas. A more modest relationship (i.e., smaller correlation coefficients) is expected to be reported between the categories and subcategories as a consequence of the lower number of items measuring each of the reporting categories. The PPM between two category or subcategory scores may be artificially low because of measurement error.

## Standard 1.21 states:

When statistical adjustments, such as those for restriction of range or attenuation, are made, both adjusted and unadjusted coefficients, as well as the specific procedure used, and all statistics used in the adjustment, should be reported. Estimates of the construct-criterion relationship that remove the effects of measurement error on the test should be clearly reported as adjusted estimates (29).

The attenuation of the PPM can be corrected statistically using Spearman's formula:

$$
\begin{equation*}
C A P P M=\frac{r_{x y}}{\sqrt{r_{x x} r_{y y}}} \tag{9.5}
\end{equation*}
$$

where $r_{x y}$ is the PPM between two claims or GLE strands, $r_{x x}$ is the reliability of one of those claims or GLE strands, and $r_{y y}$ is the reliability of the other claim or GLE strand.

ELA shows moderate relationships between the reading and writing reporting categories across all grades, indicating that these two categories measure some different traits. Across all tables, the CAPPM indicates moderate or strong relationships between subcategories. The CAPPM for reading vocabulary, written expression, and knowledge and use of language are moderate. In some cases, the CAPPM is greater than 1.0. "Disattenuated values greater than 1.00 indicate that measurement error is not randomly distributed" (Schumacker, 1996). The moderate or strong relationships suggested by the CAPPM in Tables 9.10-9.13 are further evidence of the validity of the test construct. Since the overall content area is comprised of the category or subcategories subscores and the content area is expected to measure a single dimension, these subscores are expected to be moderately or highly related.

### 9.4.2 Reliability of Reporting Categories and Subcategories

Raw score summary statistics (i.e., mean and standard deviation), Cronbach's (1951) coefficient alpha, and SEM were computed for each of the reporting categories or subcategories by grade, content area, and mode using the census data. These statistics are presented in Tables 9.14-9.17 for ELA and mathematics. Reliability indices, such as Cronbach's coefficient alpha (and resulting SEM), are a function of the number of itemson a test, the average covariance between item-pairs, and the variance of a test's total score. In general, it is expected that the coefficient alpha would be lower for a reporting category or subcategory assessed by a small number of items than for one assessed by a larger number of items.

### 9.4.3 Standard Error of Measurement of Reporting Categories and Subcategories

This chapter also reports the SEM associated with each of the reporting categories and subcategories in Tables 9.14-9.17 for ELA and mathematics. In these tables the RI/RL writing component was included. These SEMs are reported in the raw score metric.

Table 9.14 Mean, Standard Deviation, and Standard Error of Measurement (SEM) of English Language Arts Reporting Categories

### 9.5 Divergent (Discriminant) Validity

Measures of different constructs should not be highly correlated with each other. Divergent validity is a subtype of construct validity that can be assessed by the extent to which measures of constructs that theoretically should not be related to each other are, in fact, observed as not related to each other. Typically, correlation coefficients among measures of unrelated or distantly related constructs are examined in support of divergent validity.

To assess the divergent validity of the LEAP 2025 assessments, correlations were computed between the ELA, mathematics, social studies, and science scale scores for students who took more than one LEAP 2025 content-area test in 2021. These correlations are based on the census data, and the results are shown in Table 9.18. The correlation coefficients ranged from 0.71 (between mathematics and social studies in grades 3 and 5) to 0.84 (between ELA and social studies in grade). The correlation coefficients suggest that individual student scores across subjects are moderately related, indicating that these tests measure a similar knowledge base or general underlying ability while still measuring some different traits as planned.

Table 9.18 Inter-Correlation of English Language Arts and Mathematics Scale Scores

| Grade | ELA/ <br> Mathematics | ELA/ <br> Social Studies | ELA/ <br> Science | Mathematics/ <br> Social Studies | Mathematics/ <br> Science | Social Studies/ <br> Science |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 3 | 0.75 | 0.76 | 0.78 | 0.71 | 0.76 | 0.77 |
| 4 | 0.76 | 0.79 | 0.78 | 0.75 | 0.77 | 0.80 |
| 5 | 0.76 | 0.79 | 0.81 | 0.71 | 0.78 | 0.77 |
| 6 | 0.80 | 0.83 | 0.79 | 0.79 | 0.78 | 0.81 |
| 7 | 0.79 | 0.82 | 0.79 | 0.76 | 0.80 | 0.80 |
| 8 | 0.74 | 0.84 | 0.78 | 0.74 | 0.74 | 0.83 |

### 9.6 Regression of LEAP 2025 from 2019 to 2021

The LEAP 2025 assessments were designed to support an integrated educational system where the scope and sequence of each grade's curriculum will support student readiness for and achievement in the next education level. Effective measurement is expected to result in assessments that produce scores that consistently measure each grade's content and produce data that provide strong evidence of preparedness for the content measured by assessments at the education level.

In prior years, this study required the collection of data from adjacent grades for each content area. However, since LEAP 2025 was not administered in 2020, "adjacent grades" for this administration's study had to be defined differently. For this purpose, matched longitudinal LEAP 2025 test data from spring 2019 and spring 2021 were used. For example, grade 3 students were matched with grade 5 students, and only matched students were used to estimate correlation and perform linear regression from 2019 to 2021.

Table 9.19 summarizes the correlation and regression results for 2019 and 2021 LEAP 2025. For ELA, the correlation ranged from 0.75 to 0.81 , and for mathematics, the correlation ranged from 0.75 to 0.80 . Correlations for both content areas can be considered moderate, which can often be found in state assessments. $\mathrm{R}^{2}$ indicates how much of the 2019 performance can explain the 2021 performance. For example, 0.56 for ELA 2019 grade 3 and 2021 grade 5 means that 2019's grade 3 performance can explain (predict) about 56\% of 2021's grade 5 performance. This $R^{2}$ value is generally the power of 2 for the matching correlation. The $R^{2}$ values for ELA range from 0.56 to 0.66 , and those for mathematics range from 0.57 to 0.65 .

Table 9.19 Correlation and Regression Summary for 2019 and 2021 LEAP 2025

| Content | $2019$ <br> Grade | $2021$ <br> Grade | N | Correlation | $\mathrm{R}^{\mathbf{2}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ELA | 3 | 5 | $\geq 45,590$ | 0.75 | 0.56 |
|  | 4 | 6 | $\geq 47,280$ | 0.76 | 0.58 |
|  | 5 | 7 | $\geq 47,720$ | 0.79 | 0.62 |
|  | 6 | 8 | $\geq 47,480$ | 0.81 | 0.66 |
| Mathematics | 3 | 5 | $\geq 45,470$ | 0.75 | 0.57 |
|  | 4 | 6 | $\geq 47,170$ | 0.79 | 0.63 |
|  | 5 | 7 | $\geq 47,540$ | 0.8 | 0.65 |
|  | 6 | 8 | $\geq 41,860$ | 0.78 | 0.61 |

Figures 9.3 and 9.4 show regression line and scatter plots for ELA and mathematics. The linear lines in the plots are linear regression lines from 2019 to 2021. In general, the length of band given the linear regression line shows the strength of correlation. If the band is narrow, the correlation is high, and if the band is large, the correlation is low. Every plot shows some moderate linear relationships between 2019 and 2021 adjacent grades for both ELA and mathematics.

Figure 9.4 Regression Line and Scatter Plots: Mathematics

### 9.7 Summary

In summary, the overall purpose of establishing construct validity is to ensure that the interpretation of test scores is supported. Evidence of validity is necessary to justify the use of the LEAP 2025 test scores. This evidence addresses multiple best practices of the testing industry but particularly relates to the following standards.

Standard 1.13 If the rationale for a test score interpretation for a given use depends on premises about the relationships among test items or among parts of the test, evidence concerning the internal structure of the test should be provided (26).

Standard 1.21 When statistical adjustments, such as those for restriction of range or attenuation, are made, both adjusted and unadjusted coefficients, as well as the specific procedure used, and all statistics used in the adjustment, should be reported. Estimates of the construct-criterion relationship that remove the effects of measurement error on the test should be clearly reported as adjusted estimates (29).

Standard 2.0 Appropriate evidence of reliability/precision should be provided for the interpretation for each intended score use (42).

Standard 2.3 For each total score, subscore, or combination of scores that is to be interpreted, estimates of relevant indices of reliability/precision should be reported (43).

Standard 2.13 The standard error of measurement, both overall and conditional (if reported), should be provided in units of each reported score (45).

Standard 2.14 When possible and appropriate, conditional standard errors of measurement should be reported at several score levels unless there is evidence that the standard error is constant across score levels. Where cut scores are specified for selection or classification, the standard errors of measurement should be reported in the vicinity of each cut score (46).

Standard 2.16 When a test or combination of measures is used to make classification decisions, estimates should be provided of the percentage of test takers who would be classified in the same way on two replications of the procedure (46).

Standard 2.19 Each method of quantifying the reliability/precision of scores should be described clearly and expressed in terms of statistics appropriate to the method. The sampling procedures used to select test takers for reliability/precision analyses and the descriptive statistics on these samples, subject to privacy obligations where applicable, should be reported (47).

## Chapter 10: Fairness

As noted in the Standards for Educational and Psychological Testing (American Educational Research Association [AERA], American Psychological Association [APA], \& National Council on Measurement in Education [NCME], 2014), there are varying definitions of fairness. This chapter examines fairness as it relates to minimizing bias on a test. This chapter also discusses test performance among varying subgroups assessed by LEAP 2025 assessments. It should be noted that having differences in test performance among subgroups does not mean that a test is unfair-it simply means that groups perform differently on a test. Even when a test is carefully and properly constructed, differences may exist among subgroups as a result of differences in curriculum or learning by students in the subgroup.

This chapter demonstrates for the LEAP 2025 assessments adhere to AERA, APA, \& NCME Standards 3.1-3.6. These standards are from Chapter 3 of the Standards, which is titled "Fairness in Testing." Each of these standards is presented in this chapter.

Standard 3.6 states:

Where credible evidence indicates that test scores may differ in meaning for relevant subgroups in the intended examinee population, test developers and/or users are responsible for examining the evidence for validity of score interpretations for intended uses for individuals from those subgroups. What constitutes a significant difference in subgroup scores and what actions are taken in response to such differences may be defined by applicable laws (65).

Test scores of examinee subgroups that differ in meaning are an ongoing concern in any large-scale testing program. To lessen the possibility of differences in test score meaning, DRC follows several steps in the item development and item selection processes, as is explained in Section 10.1 of this chapter. In addition, the LDOE assessment research and development experts, and Louisiana educators, conduct content and bias reviews on items during the selection process, as explained in Chapter 3. These practices adhere to Standard 3.3, which states, "Those responsible for test development should include relevant subgroups in validity, reliability/precision, and other preliminary studies used when constructing the test" (64).

The PARCC consortium, as well as DRC, conducted differential item functioning (DIF) studies of their items prior to operational administrations. Items are typically evaluated for possible DIF in the field test phase of the test development process, and any items flagged for DIF are further examined to determine possible bias. During the ELA and mathematics test development process, DRC content experts tried to avoid including operational items flagged for DIF. Section 10.2 of this chapter explains the steps taken to evaluate LEAP 2025 items using DIF to adhere to Standard 3.3.

In addition, the standardized test administration practices and the extensive training process for test score interpretation for LEAP 2025 comply with Standards 3.4 and 3.5, which state:

Standard 3.4 Test takers should receive comparable treatment during the test administration and scoring process (65).

Standard 3.5 Test developers should specify and document provisions that have been made to test administration and scoring procedures to remove construct-irrelevant barriers for all relevant subgroups in the test-taker population (65).

Section 10.1 of this chapter is also directly relevant to Standards 3.1 and 3.2.
Standard 3.1 Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population (63).

Standard 3.2 Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests' being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics (64).

This chapter explains the steps taken by DRC to minimize words, phrases, and content that may be regarded as offensive by members of particular demographic subgroups. Section 3.2 of Chapter 3 discusses the content and bias review conducted for LEAP 2025. This review is also critical in fulfilling Standards 3.1 and 3.2. The PARCC operational items used in the 2018 LEAP 2025 forms were critical to the forms construction process. Refer to the PARCC website for the bias and sensitivity guidelines used and the processes and procedures followed by PARCC pertaining to these items.

### 10.1 Minimizing Bias through Careful Test Development

The construction of a test that is fair for all examinees begins in the early stages of planning and development. The item and test development processes that were used to minimize bias are summarized below.

First, careful attention was paid to content validity during the item development and item selection processes. Bias can occur only if the test is measuring different things for different groups. The possibility of bias is reduced by eliminating irrelevant skills or knowledge from the items.

Second, item writers and test developers followed PARCC Fairness and Sensitivity Guidelines for reducing or eliminating bias. DRC test development staff reviewed all items and other testing materials with these guidelines in mind. Internal editorial reviews were conducted by at least three different people: a content editor who directly supervised the item writers, a style editor, and a content supervisor. The final test was again reviewed by people in these same roles and was also subjected to an independent review by the LDOE assessment research and development specialists.

Third, careful attention was given to item statistics throughout the test development process. As part of the test assembly process, attempts were made to avoid using or reusing items with poor statistical fit or distractors with positive point biserial correlations, since this may indicate that an item is testing an ability that is irrelevant to the construct being measured. DIF statistics were also examined during test construction. Items that had exhibited significant DIF against one or more subgroups were removed from further consideration unless it was essential to include them to meet content specifications.

### 10.2 Evaluating Bias through Differential Item Functioning (DIF) Statistics

After administering the test, an empirical approach known as DIF was used to examine the items. The DIF statistics indicate the degree to which members of a particular focus group perform better or worse than expected on each item as compared to the reference group. The DIF procedures used and the results of these analyses are detailed in this section. It should be noted, however, that all items included in LEAP 2025 were thoroughly reviewed for content and bias by the LDOE and DRC content experts to ensure the items do not test knowledge or ability irrelevant to the construct the test intends to measure. Therefore, DIF flags do not necessarily indicate that an item is biased; rather, DIF flags indicate that the item functions differently for
equally able members of different groups (Camilli \& Shepard, 1994). Items are not necessarily suppressed from operational scoring if they are flagged for DIF.

The position of DRC concerning test bias is based on two general propositions. First, students may differ in their background knowledge, cognitive and academic skills, languages, attitudes, and values. To the degree that these differences are large, no one curriculum and no one set of instructional materials will be equally suitable for all. Therefore, no one test will be equally appropriate for all. Furthermore, it is difficult to specify what amount of difference can be called large and to determine how these differences will affect the outcome of a particular test. Second, schools have been assigned the tasks of developing certain basic cognitive skills and supporting development of these skills equitably among all students. Therefore, there is a need for tests that measure the common skills and bodies of knowledge that are expected of all learners. The test publisher's task is to develop assessments that measure these key cognitive skills without introducing extraneous or construct-irrelevant elements into the performances on which the measurement is based. If these tests require that students have culturally specific knowledge and skills not taught in school, differences in performance among students can occur because of differences in student background and out-of-school learning. Such tests are measuring different things for different groups and can be called biased (Camilli \& Shepard, 1994; Green, 1975).

To lessen this bias, DRC strives to minimize the role of extraneous elements, thereby increasing the number of students for whom the test is appropriate. As discussed above and in Chapter 3 of this report, careful attention is given during the test development and test construction processes to lessen the influence of these elements for large numbers of students. Unfortunately, in some cases these elements may continue to play a substantial role in some cases. To assess the extent to which items may be performing differently for various subgroups of interest, DIF analyses are conducted after each operational test administration.

DIF statistics are used to quantify differences in item performance between two groups after controlling for examinees' overall achievement level. Two DIF statistics that are commonly used for this purpose are the Mantel-Haenszel (MH) statistic (1959) and the standardized mean difference (SMD) between the reference and focal groups, proposed by Dorans and Schmitt (1991).

The MH statistic is computed as follows (Zwick, Donoghue, \& Grima, 1993):

$$
\text { Mantel } \chi^{2}=\frac{\left(\sum_{k} F_{k}-\sum_{k} E\left(F_{k}\right)\right)^{2}}{\sum_{k} \operatorname{Var}\left(F_{k}\right)}
$$

where $F_{k}$ is the sum of scores for the focal group at the $k$ th level of the matching variable. Note that the MH statistic is sensitive to $N$ such that larger sample sizes increase the value of chi-square.

In addition to the MH chi-square statistic, the delta statistic (MH-D DIF) was computed for all items. Educational Testing Service (ETS) first developed the MH-D DIF statistic. To compute delta, alpha (the odds ratio) is first computed as follows:

$$
\alpha_{M H}=\frac{\sum_{k=1}^{K} N_{r 1 k} N_{f 0 k} / N_{k}}{\sum_{k=1}^{K} N_{f 1 k} N_{r 0 k} / N_{k}},
$$

where $N_{r 1 k}$ is the number of correct responses in the reference group at ability level $k, N_{f 0 k}$ is the number of incorrect responses in the focal group at ability level $k, N_{k}$ is the total number of responses, $N_{f 1 k}$ is the number of correct responses in the focal group at ability level $k$, and $N_{r o k}$ is the number of incorrect responses in the reference group at ability level $k$. MH-D DIF is then computed as follows:

$$
\text { MH-D DIF }=-2.35 \ln \left(\alpha_{м н}\right)
$$

For selected-response items, the $\mathrm{MH}\left(\chi_{M H}^{2}\right)$ statistic was used to evaluate potential DIF items. In the MH procedure, subgroups are matched by their raw total test score, using a contingency table with $K$ ability levels. When applying the MH procedure, the log-odds ratio $\alpha$ is assumed to be constant across the $K$ matched levels. The $\chi_{M H}^{2}$, then, estimates a pooled common-odds ratio. Taking the natural logarithm of the common-odds ratio and its confidence limits and multiplying these with the constant -2.35 may then allow the resulting values to be placed on the MH delta metric ( $\Delta_{M H}$ ) for interpretive purposes. Items were flagged for DIF using the following criteria:

- Moderate DIF: Significant MH chi-square statistic (p<0.05) and $1.0 \leq \mid$ MH D-DIF $\mid<1.5$
- Large DIF: Significant MH chi-square statistic ( $p<0.05$ ) and $\mid$ MH D-DIF $\mid \geq 1.5$

For constructed-response items, an effect size (ES) statistic based on the MH chi-square will be used. The ES is obtained by dividing the SMD statistics by the standard deviation of the item. The SMD is an effect size index of DIF, which is relatively easy to interpret. The SMD compares the mean of the reference and focal group, adjusting for the distribution of reference and focal group members on the conditioning variable, which for these analyses is the LEAP 2025 raw score. The SMD is computed as follows (Zwick et al., 1993):

$$
S M D=p_{F k}\left(\sum_{k} m_{F k}-\sum_{k} m_{R k}\right),
$$

where $p_{F k}=$ the proportion of the focal group members at the $k$ th level of the matching variable, $m_{F k}=1 / N_{F 1 k}$, and $m_{R k}=1 / N_{R 1 k}$. Items are flagged using the same rules that are used in NAEP:

- Moderate DIF: If the MH statistic is significant ( $p<.05$ ) and |ES| is between 0.17 and 0.25
- Large DIF: If the MH statistic is significant ( $p<.05$ ) and $|E S| \geq 0.25$

A positive DIF value indicates that the item favors the focal group, while a negative value indicates that the item disadvantages the focal group.

### 10.2.1 DIF Statistics for Demographic Groups

DIF analyses were conducted for groups defined by demographic characteristics. Tables 10.1 and 10.2 show the DIF results for the following subgroups:

Gender: Focal group is females; reference group is males.
Ethnicity: Focal groups are Hispanic/Latino, American Indian or Alaska Native, Asian, Black or African American, and two or more races; reference group is white.

Education Classification: Focal group is students who are classified as special education; reference group is all others.

EL Status: Focal group is students who are classified as EL; reference group is all others.

Economic Status: Focal group is students who are classified as economically disadvantaged; reference group is all others.

A negative SMD value implies that the focal group has a lower mean item score than the reference group, whereas a positive value implies that the focal group has a higher mean item score than the reference group, conditioned on the matching test score.

The minimum case count for the focal group was set at 200, and the minimum case count for the reference group was set at 400. The DIF analyses are not performed for subgroups of less than 200 . In these cases, the statistical procedures do not have sufficient power to detect potential differences.

Tables 10.1 summarizes the number of DIF flags by content area, grade, and test form for each focal group that included at least 200 students. Results are not reported (NR) for groups with an insufficient number of students. The analyses were conducted by test form.

DIF statistics are produced and examined for all newly field-tested items and for all items being administered for the first time operationally in Louisiana. In the spring 2021 administration, items were field tested in grades 3 and 6 ELA.

Table 10.1 2019 LEAP 2025 DIF Statistics: Number of Flagged Items, English Language Arts

| DIF Statistics: English Language Arts |  |  |  |  | Count of Items at DIF Magnitude |  |  |  |

### 10.2.2 DIF Statistics for Test Language

All items on one CBT and one PBT form of the mathematics test at each grade are transadapted from English into Spanish. Transadaptation takes into consideration linguistic and cultural differencesand grade-level appropriate words. By accounting for these differences, the achievement of Spanish speakers can be measured in the same way as the achievement of English speakers. Please refer to Appendix C for more information about the transadaptation of Spanish mathematics forms. To help confirm that the test items can be measured similarly regardless of the language in which the items are published, a DIF set if analyses was performed in 2019, when most of the 2021 items were originally administered. Two DIF analyses were performed using the 2019 LEAP 2025 mathematics operational items, regardless of student count in the reference or focal group. Smaller counts for the groups needed to be tolerated since the overall count for those being administered the Spanish form was low.

For the first analysis, student responses for the shared operational items between 2018 and 2019 LEAP 2025 mathematics were combined. This approach increased the number of students who took the Spanish versions of the items. The Mantel-Haenszel (MH) and the Standardized Mean Difference (SMD) DIF procedures were performed on these shared items and DIF flags applied. The second analysis focused on the items that were not common between the 2018 and 2019 administrations. The MH and the SMD DIF procedures were performed on all 2019 LEAP 2025 operational items, including items that were unique to the 2019 administration in addition to those in common with the 2018 administration. However, DIF flags were applied to only the items that were not shared between 2018 and 2019.

For both analyses, DIF results were carefully reviewed whenever sample sizes were smaller than the required minimum sample size and when an item showed large (C) DIF. All items were determined by the LDOE to be suitable for scoring. Table 10.2 summarizes how many items overall exhibited moderate or large DIF in mathematics.

Table 10.2 2019 LEAP 2025 DIF Statistics: Number of Flagged Items, Mathematics

| DIF Statistics: Mathematics |  |  |  | Count of Items at DIF Magnitude |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Moderate |  | Large |  |
| Grade | Number of Items | Category | Group | B- | B+ | C- | C+ |
| 3 | 43 | Test Language | Spanish | 1 | 0 | 5 | 1 |
| 4 | 41 | Test Language | Spanish | 1 | 2 | 3 | 0 |
| 5 | 42 | Test Language | Spanish | 1 | 0 | 0 | 0 |
| 6 | 43 | Test Language | Spanish | 1 | 0 | 0 | 1 |
| 7 | 43 | Test Language | Spanish | 2 | 3 | 1 | 0 |
| 8 | 41 | Test Language | Spanish | 1 | 0 | 2 | 0 |

### 10.3 Evaluating Bias through Impact Analysis

The impact of achievement testing on subgroups can be determined and reported in the form of average scores and also in terms of test score reliability. Tables $10.4-10.19$ present the number of students, test form reliability statistics (i.e., coefficient alpha; see Chapter 9), scale score means and standard deviations, and effect size (i.e., Cohen's $d$ ) for the various subgroups of interest by form.

### 10.3.1 Reliability

Tables 10.3-10.10 show the test form reliability coefficients and SEM by student gender, ethnicity, education classification, EL status, economic status, and Section 504 status. The reliability coefficients for English language arts forms ranged from 0.75 to 0.93 . For mathematics the reliability coefficients ranged from 0.82 to 0.94 . These analyses show that the test reliability is of acceptable magnitude for all the subgroups. Note that the reliability coefficients are NR for subgroups with fewer than 10 students.

### 10.3.2 Effect Size

One way to evaluate the magnitude of the standardized mean difference (SMD) is to calculate the ES. Cohen's $d$ was used to calculate the ES. Cohen's $d$ is given by the following formula:

$$
d=\frac{\overline{x_{a}}-\overline{x_{b}}}{\sqrt{\frac{\left(n_{a}-1\right) s_{a}^{2}+\left(n_{b}-1\right) s_{b}^{2}}{\left(n_{a}+n_{b}\right)-2}}}
$$

where $\bar{x}_{a}$ is the mean score of group $\mathrm{A}, x_{b}$ is the mean score of group $\mathrm{B}, s_{a}^{2}$ is the variance of group $\mathrm{A}, s_{b}^{2}$ is the variance of group $B, n_{a}$ is the number of students in group $A$, and $n_{b}$ is the number of students in group B.

Cohen's $d$, then, expresses the difference in group means in terms of the standard deviation. For example, if $d=.34$ for two groups, then it may be interpreted that the SMD between the two groups is .34 of the pooled standard deviation. Cohen (1988) offered guidelines for interpreting the meaning of the $d$ statistic: $d=.20$ is a small ES, $d=.50$ is a medium ES, and $d=.80$ is a large ES.

Using Cohen's (1988) guidelines, certain trends become apparent in Tables 10.11-10.18. Results are NR for subgroups with fewer than 10 students. If the effect size is negative, that means the group performs at a higher level than the group to which it's being compared. A positive effect size indicats the group performs at a lower level than the group to which it is being compared. For example, in Table 10.11 in regards to the ELA test, the effect size for the group female is -0.10 indicating that althouth there is less than a small difference in performance, females are scoring higher than males. On the ELA test in most grades, there are small differences in mean test scores at grades, 6, 7, and 8 between females and males where females outperform males. For most ELA and mathematics tests, mean scale scores and ES show that Asian and white students tend to outperform other ethnicity groups across grades. For most ELA and mathematics tests, there were clear performance differences between regular education and special education students in Education Classification, between not economically disadvantaged and economically disadvantaged in economic status, and non-EL and EL students in EL status.

Additional data for mean scale scores are provided in Tables 10.19 and 10.20. These tables report the number of students, mean scale scores, and standard deviations for special education classification. Groups that have fewer than 50 students are NR.

Table 10.19 Special Education Classification Scale-Score Means and Standard Deviations: English Language Arts

### 10.4 Mode Effect Study

It is also important to evaluate fairness in test administration in addition to evaluating fairness by examining performance among subgroups. The 2021 LEAP 2025 ELA and mathematics tests were administered as both paper-based tests (PBTs) and computer-based tests (CBTs) for grades 3 and 4 . The Standards indicate that results across different testing modes should be comparable. A mode comparability study was not conducted in 2021 as the forms were primarily the intact forms from 2019. Only one item on the grade 3 mathematics form was from 2018. In both 2018 and 2019, mode comparability studies were conducted. For details regarding the mode comparability study, see the 2019 LEAP 2025 Grades 3-8 Operational Technical Report: English Language Arts and Mathematics. At a summary level, the mode comparability for the 2019 LEAP 2025 CBT and PBT in grades 3 and 4 was investigated using the following steps:

- The mode effect study was performed using the CBT as the focal group and the PBT as the reference group.
- The study was based on equivalent groups design. Equivalent PBT students that match CBT students were selected using propensity score matching (PSM).
- At the item level, DIF analysis was performed using the PSM samples.
- At the test level, ESs based on difference scores of scale scores between the CBT and the PBT were used to examine the mode effect.
- Similar to PARCC's decision to not apply a mode adjustment, the LDOE also decided to not apply any mode adjustment to the LEAP 2025.

Although the PSM mode study was not conducted in 2021, DIF statistics were used to identify item performance differences across mode of administration. The Mantel-Haenszel ( MH ) statistic and the standardized mean difference (SMD) were used as DIF statitiscs on the grades 3 and 4 ELA and mathematics operational items to determine if the items performed differently across modes. In this analysis, the PBT administration was considered the focal group and the CBT administration the reference group. Table 10.21 summarizes the count of DIF flags for each subject. In ELA, only a few items displayed moderate DIF, one item in grade 3 and two items in grade 4. Large DIF was displayed on two items in grade 3 mathematics one item in grade 4. Of the flagged items, only one, in grade 4 mathematics, was also flagged in 2019.

Table 10.21 2021 LEAP 2025 DIF Statistics: Number of Flagged Items, Mode

| DIF Statistics: Mode |  |  |  | Count of Items at DIF Magnitude <br> Large |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Subject | Grade | Number <br> of Items | Group | B- | B+ | C- | C+ |
| ELA | 3 | 32 | Paper | 0 | 1 | 0 | 0 |
|  | 3 | 34 | Paper | 1 | 1 | 0 | 0 |
|  | 4 | 43 | Paper | 0 | 0 | 2 | 0 |

### 10.5 Summary

In summary, the overall purpose of this chapter is to address fairness concerns that are relevant to the administration of LEAP 2025 assessments. The information in this chapter addresses multiple best practices of the testing industry and is particularly related to the following standards:

Standard 3.1 Those responsible for test development, revision, and administration should design all steps of the testing process to promote valid score interpretations for intended score uses for the widest possible range of individuals and relevant subgroups in the intended population (63).

Standard 3.2 Test developers are responsible for developing tests that measure the intended construct and for minimizing the potential for tests' being affected by construct-irrelevant characteristics, such as linguistic, communicative, cognitive, cultural, physical, or other characteristics (64).

Standard 3.3 Those responsible for test development should include relevant subgroups in validity, reliability/precision, and other preliminary studies used when constructing the test (64).

Standard 3.4 Test takers should receive comparable treatment during the test administration and scoring process (65).

Standard 3.5 Test developers should specify and document provisions that have been made to test administration and scoring procedures to remove construct-irrelevant barriers for all relevant subgroups in the test-taker population (65).

Standard 3.6 Where credible evidence indicates that test scores may differ in meaning for relevant subgroups in the intended examinee population, test developers and/or users are responsible for examining the evidence for validity of score interpretations for intended uses for individuals from those subgroups. What constitutes a significant difference in subgroup scores and what actions are taken in response to such differences may be defined by applicable laws (65).

Standard 3.16 When credible research indicates that test scores for some relevant subgroups are differentially affected by construct-irrelevant characteristics of the test or of the examinees, when legally permissible, test users should use the test only for those subgroups for which there is sufficient evidence of validity to support score interpretations for the intended uses (70).

## Appendix A-Accommodated Print Form Creation

## Guidelines for Building Accommodated Print Forms

Careful consideration is given to all items that are used for accommodated print (AP) forms and/or braille forms. Fairness for all populations, item integrity, and student-item interaction for technology-enhanced (TE) items are factors when selecting items that will appear on an AP form. TE items used for AP are modified as described below to allow the student to interact with the item in a way similar to the online interaction, thereby maintaining both the rigor and the content being assessed.

- Drag-and-drop items in the online environment require a student to place the answer options in an interactive table. For the AP form, the student is presented with a table with the same information as the interactive table (column or row headers, any completed cells, and blank spaces) and the answer options are listed below the table (similar to the online form in which the options are listed either below or to the right of the table). For ELA drag-and-drop items, a number or letter is added in front of each of the draggers and the directions are modified to ask the student to write only the corresponding letters and/or numbers in the table rather than having a student write out long answers. In mathematics, the directions are modified to ask the student to write the correct answer in its corresponding box. Students are also able to circle the text and draw arrows to indicate where it should be placed or add labels to the answer choices and write only the label in the box, as long as the intended response is clear to the test administrator who will transcribe the answers into the online system.
- Match interaction table items in the online environment require a student to select a checkbox in one or more columns for each of multiple rows. In the AP form, the student is provided with a table and asked to mark an X in the correct places.
- Highlight-text items or item parts in the online environment require a student to click on the selected text, which highlights the selected word, phrase, or sentence. In the AP form, the text is presented in the same format and the student is asked to circle the answer. Where only certain words or phrases are selectable in the online system, those options are underlined in the AP form to indicate which words and/or phrases the student should select from.
- Drop-down menu items in the online environment have answer options in a drop-down menu format, oftentimes as part of a complete sentence. The AP form displays the item with a blank line in place of the drop-down menu in the sentence, with all the answer options for the drop-down menu presented vertically below the sentence. The directions are then modified to ask the student to circle the word/phrase that belongs in the blank.
- Short answer items in the online environment require a student to type the answer in a box. In the AP form, a box is provided for the student to write the response.
- Keypad input items in the online environment require a student to enter a numeric response including all rational and irrational numbers as well as expressions and equations. In the AP form, a box is provided for the student to write the response.
- Graphing items, including coordinate planes, number lines, line plots, and bar graphs, in the online environment require a student to complete a graph by plotting points, adding Xs to create a line plot, or raising/lowering bars to create a bar graph or histogram. In the AP form, the student is provided with the same coordinate plane, number line, line plot, or bar graph as in the online item, including titles, axis labels, and keys, and is asked to complete the graph.

Displaying items similarly in both print and online, and allowing the student to interact with the item in a similar manner, maintain the item integrity by assessing a similar construct in a similar manner, providing students who are unable to access the assessment online with an assessment at the same level of rigor as the online test.

AP forms are thoroughly reviewed by DRC and LDOE content experts to ensure a valid and reliable assessment for students who are unable to participate in the online assessment. These forms are also used as the source files for the creation of braille forms for students in grades 5-8 in ELA and mathematics.

## Appendix B—Transadaptation Process for Spanish Mathematics Forms

For English Learners, the LDOE offers the mathematics assessments in Spanish for both computer-based tests (CBT) in all grades and paper-based tests (PBT) in grades 3 and 4 only to mirror the English language forms, the text-to-speech (TTS) for CBT and large print and human voice audio CDs for PBT forms. The Spanish language versions of the test were developed through transadaptation. Transadaptation takes into consideration the grade-level appropriateness of the words and sentence structures used and the linguistic and cultural differences that exist between speakers of two different languages. Accounting for these differences allows experts to ensure that a Spanish language version of an item will measure the same construct as the English-language version of the item at the same level of rigor. The item is therefore expected to measure the achievement of English learners in the same way that the English version of the item does for native speakers of English.

Once the operational form was approved in English, DRC provided item IDs for acquired items to New Meridian, who then identified which of those items had previously appeared on a Spanish transadapted form. Once New Meridian identified the items that had previously been transadapted and provided the transadaptations of those items, DRC identified the English version of all items that had not been previously transadapted (either because they were Louisiana-owned items that would appear in field-test positions or because they were acquired items that had not been previously used on a Spanish-language form by PARCC). These items were then provided to the Spanish transadaptation subcontractor for initial transadaptation. DRC's Spanish Test Development Team reviewed the previously transadapted items to ensure consistency between those items transadapted as part of the PARCC assessments and those transadapted specifically for Louisiana. The team provided guidance to the translator conducting the initial transadaptation in grade-level and culturally appropriate ways. Upon completion of the transadaptation by the subcontractor, DRC's Spanish Test Development team conducted reviews by native Spanish speakers for content and grade-level appropriateness of the transadaptation. The team also conducted an editorial review. At least two members of DRC's Spanish Test Development team compared each English item to the Spanish transadaptation to ensure that the transadaptation:

- was accurate;
- contained grade-appropriate wording;
- contained answer choices that were reasonably parallel;
- did not introduce ambiguity into the Spanish version;
- contained graphics that were clearly transadapted;
- did not alter current teaching and learning practices in the content area; and
- remained free of gender, ethnic, cultural, socioeconomic, and regional bias.

The Spanish Test Development team then reconciled any discrepancies and submitted the transadaptations to a senior Spanish Test Development team member for resolution. After approval by the senior Spanish Test Development team member, the item moved forward to be imported into DRC's item banking system.

Both previously transadapted items and newly transadapted items were imported into DRC's item banking system and formatted for online use. Each Spanish item was paired with the corresponding English item in the item bank, and the Spanish item was formatted. Graphics for the item were then finalized for review. The
finalized transadaptation was then compared to the Spanish version of the item in the DRC assessment system and the English version of the item, and all changes were verified.

DRC's Spanish Test Development team then used the final, approved communication assistance scripts in English to transadapt descriptions of graphics as necessary. These descriptions were used when preparing the TTS forms for review. Scripting the TTS forms and reviewing the finalized Spanish forms were conducted by native Spanish speakers at DRC prior to submitting the forms to the LDOE for a translation review by a thirdparty translation vendor. The vendor reviewed the transadapted forms and provided feedback to the LDOE and DRC. Experienced DRC Spanish Test Development team members and the translation vendor resolved any issues, and DRC made modifications as necessary. The forms were then approved by both DRC and the LDOE translation vendor.

## Staffing and Schedule

## Training and Scoring Schedule

DRC's spring 2021 reader training and scoring schedule is based on the spring testing windows of April 15, 2021 - May 21, 2021 (LEAP 2025 high school) and April 26, 2021 - May 26, 2021 (LEAP 2025 grades 3-8). High school Administrative Error (AE) testing ends on May 25, 2021. Anticipated reader training and scoring dates are noted below.

Due to site capacity limitations in DRC scoring facilities necessitated by the COVID-19 pandemic, reader training and handscoring for the spring 2021 administration of LEAP 2025 high school and grades 3-8 assessments will be conducted using both site-based and remote approaches (as indicated in the Training and Scoring Schedule below). Site-based projects will take place in the secure DRC scoring facilities in the locations noted. Remote project training and scoring will be conducted from within DRC's secure, remote online training/scoring environment.

| Grade/Content Area or Test | DRC Scoring Location | Anticipated Staffing | 2021 Reader <br> Training and Scoring Window |
| :---: | :---: | :---: | :---: |
| 3 ELA | Remote | 2 Scoring Directors, 6 Team Leaders, 42 Readers | June 1-June 18 |
| 4 ELA | Remote | 2 Scoring Directors, 6 Team Leaders, 42 Readers | June 1-June 18 |
| 5 ELA | Remote | 1 Scoring Director, 2 Team Leaders, 22 Readers | April 26 - May 28 |
| 6 ELA | Remote | 1 Scoring Director, 1 Team Leader, 6 Readers | April 26 - May 28 |
| 7 ELA | Remote | 1 Scoring Director, 1 Team Leader, 6 Readers | April 28 - June 1 |
| 8 ELA | Remote | 1 Scoring Director, 1 Team Leader, 6 Readers | April 28 - June 1 |
| 3 Math | Remote | 2 Scoring Directors, 5 Team Leaders, 50 Readers | June 1- June 18 |
| 4 Math | Plymouth, MN | 2 Scoring Directors, 4 Team Leaders, 30 Readers | June 1-June 18 |
| 5 Math | Remote | 2 Scoring Directors, 4 Team Leaders, 40 Readers | April 27 - June 1 |
| 6 Math | Remote | 2 Scoring Directors, 4 Team Leaders, 26 Readers | April 28 - June 1 |
| 7 Math | Remote | 2 Scoring Directors, 5 Team Leaders, 50 Readers | April 26 - May 28 |
| 8 Math | Remote | 2 Scoring Directors, 4 Team Leaders, 40 Readers | April 27 - June 1 |
| 3 Science (CRs) | Remote | 1 Scoring Director, 3 Team Leaders, 16 Readers | June 1-June 18 |
| 4 Science (CRs) | Remote | 1 Scoring Director, 3 Team Leaders, 16 Readers | June 1-June 18 |
| 3 \& 4 Science (ERs) | Remote | 1 Scoring Director, 1 Assistant Scoring Director, 7 Team Leaders, 48 Readers | June 1 - June 18 |

Scorers will be divided by test as detailed in the table. Depending on the overall progress of the project, more scorers may be added to some groups. Additionally, depending on the overall progress of the project, some groups may subdivide and work on different items.

## Scorer Degree Requirements

DRC readers scoring for Louisiana have at least a four-year college degree. DRC has a Human Resources Director dedicated solely to recruiting and retaining our handscoring staff. In the screening process, preference is given to candidates with previous experience scoring large-scale assessments and with degrees emphasizing the appropriate content areas. During personal interviews, reader candidates are asked to demonstrate their own proficiency in writing by responding to a DRC writing topic and in mathematics by solving word problems with correct work shown. All of this results in a highly educated and diverse workforce. Our personnel files for readers and Team Leaders include evaluations for each project completed. We use these evaluations to place individuals on projects that best fit their professional backgrounds, their college degrees, and their performance on similar projects at DRC.

## Security

Whether training and scoring are conducted within a DRC facility or done remotely, security is essential to our handscoring process. When users log into DRC's secure, web-based scoring application, ScoreBoard, they are required to read and accept our security policy before they are allowed to access any project. For each project, scorers are also required to read and sign non-disclosure agreements, and during training emphasis is always given to what security means, the importance of maintaining security, and how this is accomplished.

Readers only have access to student responses they are qualified to score. Each scorer is assigned a unique username and password to access DRC's imaging system and must qualify before viewing any live student responses. DRC maintains full control of who may access the system and which item each scorer may score. No demographic data is available to scorers at any time.

Each DRC scoring center is a secure facility. Access to scoring centers is limited to badge-wearing staff and to visitors accompanied by authorized staff. All readers are made aware that no scoring materials may leave the scoring center. To prevent the unauthorized duplication of secured materials, cell

Page 2
6.4.21 | DRC Proprietary and Confidential
phone/camera use within the scoring rooms is strictly forbidden. Readers only have access to student responses they are qualified to score.

In a remote environment, security reminders are given on a daily basis. Similar to the work that occurs within DRC scoring sites, in a remote environment, education about security expectations is the best way to maintain security of any project materials. DRC requires scorers working remotely to work in a private environment away from other people (including family members). Restrictions are in place that define the hours during the day scorers are able to log into the system. If any type of security breach were to occur, immediate action would be taken to secure materials, and the employee would be terminated. DRC has the same policy within our scoring sites.

## Remote Scoring Overview

## Background

DRC's remote scoring is designed to very closely emulate the work that is done in our physical scoring locations. The platform, content, and expectations for quality remain the same, and interactive technology and content training and discussions are conducted live (virtually). The differences come with the method through which training is delivered (online), and in the modes of communication that are used (web screen sharing, webcast, video chat, and chat). Our scoring leaders are equipped with a variety of tools to ensure every scorer is successful in understanding and applying scoring criteria to student responses. For a detailed explanation of DRC's remote scoring process, refer to Appendix B.

## Experience

Of the assessments from other clients' programs that continued to be administered and scored during spring 2020 and winter 2021, DRC successfully utilized over 900 DRC scoring professionals working remotely to meet both timelines and quality expectations. The successful transition from site-based to remote scoring was made possible by leveraging existing tools with modified and enhanced procedures to provide our teams the needed resources and support. Our team looks forward to collaborating with LDOE to refine and modify existing remote scoring processes to reflect their unique requirements.

## System Tools - Scoring, Training, Chat

ScoreBoard is DRC's secure, web-based scoring application that is designed to be used in a distributed environment. Our platform is used within our scoring centers and in remote locations (e.g., in a scorer's home). Our integrated training resources provide the capability to securely maintain digital training materials within the scoring platform itself.

Live, interactive training is conducted via Moodle Learning Management System, which mirrors aspects of the scoring room and provides a versatile platform for training. It also serves as a place to share files of important documents such as daily scoring statistics, selected training materials, and platform user guides. Through embedded communication tools, Scoring Directors, Assistant Scoring Directors, and Team Leaders are able to facilitate group or one-on-one training sessions and discussions using audio and video.

Zulip is the chat tool used in conjunction with ScoreBoard and Moodle to facilitate instant communication between Scoring Directors, Assistant Scoring Directors, Team Leaders, and Scorers. Zulip provides a tool for scorers to be able to directly ask supervisors questions about responses and allows supervisors to direct individual or groups of scorers to join Moodle training rooms for important discussions and retraining.

## Content Training with Moodle

Content training remains an interactive, comprehensive, hands-on experience. Scoring Directors train each scoring group by screensharing PDFs of training materials as they progress through training. Each training example is displayed individually, and supervisors are able to use text highlighting, etc., to draw scorers' attention to relevant parts of the responses. Throughout the training, supervisors continue to guide the discussion, and scorers continue to be able to pose questions to supervisors. All secure materials such as passages/sources, anchors, training sets, and/or qualifying sets are accessible for scorers and Team Leaders in ScoreBoard, which does not permit anything to be downloaded or printed. Scorers are not permitted to download, print, or take screenshots of any confidential materials, including test items and student responses. Supplemental documents that are not secure, such as the ELA writing task rubrics and nonscore definitions may be located in Moodle where users have the capability to download or print. The Scoring Director directs the Team Leaders and scorers to take their training and qualifying sets, following the same training flow as they would in the scoring facility. This is described in the Content-Specific Training section below (see Appendix B for a detailed description of tools and procedures used in remote training/scoring).

## Quality Control

Our robust quality control processes and handscoring metrics (detailed later in this document) remain in place for all projects scored remotely. Scored responses are monitored with second reads exactly as they are at the scoring sites. Read-behinds are also conducted in the exact same manner; however, any conversations and/or retraining needed as a result of the monitoring are held in one-on-one video chat sessions. DRC scoring leadership has found this to be a very effective and efficient way to adjust any training and clarify scoring decisions for scorers. Handscoring quality reports continue to be available for all projects on a regular basis for both project leadership and LDOE.

## Content-Specific Training

In preparation for the scoring of all LEAP 2025 items, DRC scoring supervisors will train readers using the same content-specific training materials that were used for prior administrations of the same items. These training materials originated from the sources noted below.

Reader training materials for the following were developed by DRC in conjunction with LDOE:

- LEAP 2025 grades 3-8 Science and Social Studies, as well as select items for grades 3-8 Math (noted as DRC Material Type on pages 11-13)
- LEAP 2025 Biology and U.S. History, as well as select items for Algebra I and Geometry (noted as DRC Material Type on pages 10-11)

Page 4

Reader training materials for the following were provided to DRC by New Meridian and were approved by the Partnership for Assessment of Readiness for College and Careers (PARCC):

- LEAP 2025 grades 3-8 ELA and Math items developed by PARCC
- LEAP 2025 Algebra I, Geometry, English I, and English II items developed by PARCC

The materials include:

- Passages, items/prompts, associated source/stimuli for applicable tests and item types;
- Rubrics;
- Anchor Sets;
- Training Sets (or Practice Sets); and
- Qualifying Sets.

DRC will start the training with a review of passages/sources, items/prompts, rubrics, and anchor responses, followed by the scoring and discussion of Training/Practice Sets and the scoring and discussion of Qualifying Sets. Once this process has been completed for an item or prompt, qualified readers will be able to start scoring live student responses. A group of scorers will score responses for a particular item until the scoring for that item is complete. Then they may move on to score a different item. Depending on the overall progress of the project and the current quantity of responses available to score for each item, some groups may subdivide and work on different items. Additionally, depending on the overall progress of the project, more scorers may be added to some groups when the groups are ready to score new items.

The following tables detail the composition of the training materials for the spring 2021 administration of the LEAP 2025 grades 3-8 and high school assessments.

## Training Materials

## LEAP 2025 Biology, U.S. History, and Grades 3-8 Science and Social Studies

Reader training for LEAP 2025 Biology, U.S. History, and grades 3-8 science and social studies is conducted using item-specific anchor sets, training sets, and qualifying sets developed by DRC.

| Set Type | Biology, U.S. History, and Grades 3-8 Science and Social Studies Training <br> Materials | Annotated |
| :--- | :--- | :--- |
| Anchor Set | Most item-specific anchor sets contain at least two responses per score point <br> (with at least one example of each of the top scores).* | Yes |
| Training Sets | There are at least two training sets for each item <br> $\bullet \quad 10$ responses per training set <br> $\bullet \quad$ All numeric score points are represented* | No |
| Qualifying Sets | There are two qualifying sets for each item <br> $\bullet \quad 10$ responses per qualifying set | No |
| *Examples of responses at the top score points or for all score-point combinations may not be present in some <br> anchor, training, and qualifying sets as there may have been few or no examples found during rangefinding or <br> subsequent field test scoring. In such cases, DRC Scoring Directors identify examples of these scores during live <br> scoring to supplement later reader retraining/recalibration as needed. |  |  |

LEAP 2025 Algebra I, Geometry, and Grades 3-8 Math (Items and Materials Developed by DRC)
Training materials for math items developed and field tested by DRC are made up of item-specific anchor sets, training sets, and qualifying sets developed by DRC.

| Set Type | Algebra I, Geometry, and Grades 3-8 Math Training Materials | Annotated |
| :--- | :--- | :--- |
| Anchor Set | Each item-specific anchor set contains at least two responses per score <br> point (with at least one of each of the top score points). | Yes |
| Training Sets | There are two training sets for each item representing the range of <br> responses <br> $\bullet \quad 10$ responses per training set <br> $\bullet \quad$ All numeric score points are represented | No |
| Qualifying Sets | There are three qualifying sets for each item <br> $\bullet \quad 10$ responses per qualifying set <br> $\bullet \quad$ All numeric score points are represented | No |

LEAP 2025 Algebra I, Geometry, English I, English II, and Grades 3-8 ELA and Math (Items and Materials Developed by PARCC)
DRC will use the PARCC-approved training and qualifying materials provided by New Meridian for all English I, English II, and grades 3-8 ELA items as well as for the Algebra I, Geometry, and grades 3-8 math items not developed by DRC. Training materials for each item can be grouped into one of two categories: "prototype" item materials or "abbreviated" item materials. [Note: Like the PARCC "prototype" items for math, full sets of training and qualifying materials were also developed for all DRC-developed math items. The training and qualifying procedures that DRC uses for these items is the same process as outlined below for PARCC-approved math "prototype" items.]

## Prototype Item Materials

PARCC selected one item that was representative of each PARCC task type to serve as a prototype item. For each prototype item, full sets of training materials were developed which consist of Anchor Sets, Practice Sets, and Qualifying Sets. DRC will start the training with a review of prototype passages/items, rubrics, and anchor responses, followed by the scoring and discussion of Practice Sets and the scoring and discussion of Qualifying Sets. Once this process has been completed for a prototype item included on the Louisiana form, qualified readers will start scoring live student responses for that item. If the prototype is not one of the items included on the current Louisiana form, qualified readers will complete their training using abbreviated item training materials for the item that they will score as described below.

## Abbreviated Item Materials

Unlike prototype items, abbreviated item training materials have only two item-specific Practice Sets and no Qualifying Sets; therefore, abbreviated items require a two-step training/qualifying process. First, scorers will train and qualify as described in the Prototype Item Materials section above using the training materials for an associated prototype item that is similar to the abbreviated one they will be scoring on the Louisiana form. ${ }^{1}$ Readers who do not qualify on the prototype item will not be allowed to continue the training.

After qualifying on the associated prototype item, readers receive additional item-specific training on the abbreviated item, the actual item, they are going to score. This consists of an item-specific Anchor Set and two item-specific Practice Sets. After completing the training for the abbreviated item, readers may begin scoring live responses for the item.
${ }^{1}$ Item associations were determined by PARCC and Pearson with the understanding that aspects of training are generalizable across similar items. For mathematics, the determination of prototype versus abbreviated items was made by PARCC and Pearson based on similar item types and by evidence statements. For ELA items, this determination by PARCC and Pearson was based on task type.

Page 7

The following tables detail the composition of the training materials provided by New Meridian for math and ELA:

Algebra I, Geometry, and Grades 3-8 Math Training Set Composition

| Set Type | Mathematics Prototype Item Training | Annotated |
| :--- | :--- | :--- |
| Anchor Set | 3 responses per score point (Composite items will have 3 responses per composite <br> score) | Yes |
| Practice <br> Set 1 | 10 responses representing the range of responses | Yes |
| Practice <br> Set 2 | 10 responses representing the range of responses | Yes |
| Qualifying <br> Set 1 | 10 responses comparable to the anchor set responses | No |
| Qualifying <br> Set 2 | 10 responses comparable to the anchor set responses | No |
| Qualifying <br> Set 3 | 10 responses comparable to the anchor set responses | No |

| Set Type | Mathematics Abbreviated Item Training | Annotated |
| :--- | :--- | :--- |
| Anchor Set | 3 responses per score point (Composite items will have 3 responses per composite <br> score) | Yes |
| Practice <br> Set 1 | 10 responses representing the range of responses | Yes |
| Practice <br> Set 2 | 10 responses representing the range of responses | Yes |

Page 8

English I, English II, and Grades 3-8 ELA Training Set Composition

| Set Type | English Prototype Item Training | Annotated |
| :---: | :---: | :---: |
| Anchor Set (for the RCWE and WE traits) | 3 responses per score point <br> - Anchor Sets for prototype RST and LAT item training include scores for the combined trait Reading Comprehension and Written Expression (RCWE). <br> - Anchor sets for prototype NWT item training include scores for Written Expression (WE). | Yes |
| Anchor Set (for the Knowledge and Use of Language Conventions trait) | - There are 3 responses per score point in each set. <br> - There are two mixed-prompt Anchor Sets per grade level (one set for NWT item training, another set for LAT/RST item training). These sets are not exclusive to specific prototype or abbreviated items; they are intended to familiarize readers with the conventions features appropriate to each task type. <br> - Subsequent Practice Sets for prototype and abbreviated items will require readers to practice scoring the Knowledge and Use of Language Conventions trait along with the RCWE trait (for LAT or RST) or with the WE trait (for NWT). <br> - In addition, readers will be required to qualify on the Knowledge and Use of Language Conventions trait during each prototype item qualifying session. | Yes |
| Practice <br> Set 1 | 5 responses representing the range of responses for <br> - the RCWE trait (for LAT and RST items) <br> - the WE trait (for NWT items) | Yes |
| Practice Set 2 | 5 responses representing the range of responses for the Knowledge and Use of Language Conventions trait | Yes |
| Practice Set 3 | 10 responses representing the range of responses for both traits appropriate to the task type | Yes |
| Practice <br> Set 4 | 10 responses representing the range of responses for both traits appropriate to the task type | Yes |
| Qualifying Set 1 | 10 responses comparable to the anchor set responses (includes both traits appropriate to the task type) | No |
| Qualifying Set 2 | 10 responses comparable to the anchor set responses (includes both traits appropriate to the task type) | No |
| Qualifying Set 3 | 10 responses comparable to the anchor set responses (includes both traits appropriate to the task type) | No |
| Direct Copy <br> Set* | 3-5 responses composed entirely or partially of text copied from the passage or passages (includes both traits appropriate to the task type) | Yes |
| *The PARCC-approved Direct Copy sets provide additional annotated sample responses that explain the scoring rationale for responses composed entirely or partially of text copied from the source passage(s) associated with an item. DRC scoring supervisors review these item-specific sets with the readers prior to scoring the associated item. |  |  |

Page 9

English I, English II, and Grades 3-8 ELA Training Set Composition (continued)

| Set Type | English Abbreviated Item Training | Annotated |
| :--- | :--- | :--- |
| Anchor Set <br> (for the <br> RCWE and <br> WE traits) | 3 responses per score point <br> $\bullet \quad$Anchor Sets for abbreviated RST and LAT item training include scores for the <br> combined trait Reading Comprehension and Written Expression (RCWE). <br> Anchor Sets for abbreviated NWT item training include scores for Written Expression <br> (WE). | Yes |
| Practice <br> Set 1 | 10 responses representing the range of responses for both traits appropriate to the task <br> type (the two traits appropriate to LAT and RST items are RCWE and Knowledge and Use <br> of Language Conventions; the two traits appropriate to NWT items are WE and Knowledge <br> and Use of Language Conventions) | Yes |
| Practice <br> Set 2 | 10 responses representing the range of responses for both traits appropriate to the task <br> type (the two traits appropriate to LAT and RST items are RCWE and Knowledge and Use <br> of Language Conventions; the two traits appropriate to NWT items are WE and Knowledge <br> and Use of Language Conventions) | Yes |

## Algebra I Items and Associated Training Materials

| Question | Form | DRC Item ID | PARCC UIN | Material Type | Associated Prototype <br> Item* |

## Qualifying

Scorers must demonstrate their ability to apply the scoring criteria by qualifying (i.e., scoring with acceptable agreement with true scores on qualifying sets). After each qualifying set has been scored, the DRC Scoring Director responsible for training the item will lead the scorers in a discussion of the set.

Any scorer who does not qualify by the end of the qualifying process for an item will not be allowed to score actual student work for that item.

In order to maintain scoring comparability with prior administrations of the same items, DRC will use the same qualifying standards for the spring 2021 administration of the LEAP 2025 items as were established when these items were scored previously.

## LEAP 2025 Constructed-Response and Extended-Response Items

For all LEAP 2025 ELA and math CR items, DRC will follow the same qualification standards determined by PARCC. A description of these qualifying standards is below.

LEAP 2025 English I, English II, and Grades 3-8 ELA

| Test | Qualifying Standard |  |
| :--- | :--- | :--- |
| English I, <br> English II, <br> and Grades <br> 3-8 ELA | Perfect Agreement | Perfect Plus Adjacent Agreement <br> qualifying sets |
|  | $70 \%$ on each trait at least once across three <br> qualifying sets | $96 \%$ across the three qualifying sets <br> combined on both traits |

Readers of English I, English II, and grades 3-8 ELA responses are required to meet all three of the qualifications listed in the table. Perfect Plus Adjacent Agreement of $96 \%$ means that out of the entire pool of a reader's scores across the three qualifying sets for an item, no more than $4 \%$ of those scores can be non-adjacent. In other words, no more than 2 of the 60 applied scores can be non-adjacent ( 3 sets $\times 10$ responses/set $\times 2$ traits $=60$ applied scores).

LEAP 2025 Algebra I, Geometry, and Grades 3-8 Math

| Test | Qualifying Standard |  |  |
| :--- | :--- | :--- | :--- |
| Algebra I, <br> Geometry, <br> and Grades <br> $3-8 ~ M a t h ~$ | Comprehensive | Perfect Agreement | Perfect Plus Adjacent Agreement |
|  | $0,1,2,3,4$ Rubric | $70 \%$ on two of three sets | $96 \%$ on two of three sets |

| Test | Qualifying Standard |  |  |
| :---: | :---: | :---: | :---: |
| Algebra I, Geometry, and Grades 3-8 Math | Composite (multipart) Items* | Perfect Agreement | Perfect Plus Adjacent Agreement |
|  | 0,1 Rubric | 90\% on two of three sets | 100\% on two of three sets |
|  | 0, 1, 2 Rubric | 80\% on two of three sets | 96\% on two of three sets |
|  | 0, 1, 2, 3 Rubric | 70\% on two of three sets | 96\% on two of three sets |
|  | 0, 1, 2, 3, 4 Rubric | 70\% on two of three sets | 95\% on two of three sets |

*For mathematics composite items, the appropriate qualifying standard should be achieved on each part of the item. For example, if an item has Part A with a top score of 1, Part B with a top score of 2, and Part $C$ with a top score of 3 , a scorer/supervisor would need to achieve $90 \%$ perfect agreement on Part A, $80 \%$ perfect agreement on Part B, and $70 \%$ perfect agreement on Part C, with no more than one nonadjacent score per part across all three qualifying sets.

LEAP 2025 U.S. History and Grades 3-8 Social Studies

| Test and Item Type | Qualifying Standard |
| :--- | :--- |
| U.S. History and <br> Grades 3-8 Social Studies <br> $0-2$ point CRs | Scorers must qualify with 80\% exact agreement or higher on one or more of <br> the qualifying sets in order to score student responses. |
| U.S. History and <br> Grades 5-8 Social Studies <br> 0-8 point, 2-dimension ERs <br> (Content, 0-4; Claims, 0-4) | Scorers must qualify with 70\% exact agreement or higher in both the Content <br> trait and the Claims trait on one or more of the qualifying sets in order to <br> score student responses. Since scorers complete two sets, they may qualify on <br> one trait in the first set and the other trait in the second set. |

LEAP 2025 Biology and Grades 3-8 Science

| Test and Item Type | Qualifying Standard |  |
| :---: | :---: | :---: |
| Biology and Grades 3-8 Science 0-2 point CRs | 0-2 Rubric | Scorers must qualify with $80 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
| Biology and <br> Grades 3-8 Science <br> Composite <br> (multi-part) ER items* | 0-1 Rubric | Scorers must qualify with $90 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-2 Rubric | Scorers must qualify with $80 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-3 Rubric | Scorers must qualify with 70\% exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-4 Rubric | Scorers must qualify with $70 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-5 Rubric | Scorers must qualify with $70 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-6 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-7 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
|  | 0-8 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
| Grades 3 and 4 Science <br> Comprehensive <br> (single part) ER items | 0-6 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |
| Biology and Grades 5-8 Science Comprehensive (single part) ER items | 0-9 Rubric | Scorers must qualify with $60 \%$ exact agreement or higher on one or more of the qualifying sets in order to score student responses. |

*Qualifying Sets are made up of 10 responses comparable to the Anchor Set responses. For composite (multipart) Biology and grades 3-8 Science ERs, the appropriate qualifying standard should be achieved on each part of the item. For example, if an item has Part A with a top score of 6 and Part B with a top score of 3 , a scorer would need to achieve $60 \%$ perfect agreement on Part A and $70 \%$ perfect agreement on Part B on one or more of the qualifying sets. A scorer may qualify on one part in the first qualifying set and the other part in the second qualifying set.

## Spring 2021 Scoring Plan

The charts below provide an overview of the Spring 2021 LEAP 2025 scoring plan, detailing the types of scoring that will be done for each course/grade.

LEAP 2025 High School

| Test | Handscoring Only | Al Scoring | AI Vendor |
| :---: | :---: | :---: | :---: |
| LEAP 2025 English I | RST_VH017542_2T (Form A - AE) <br> NWT_VH084830 (Form A -AE) | NWT_GG604245591 (Form E) <br> RST_GG431834057 (Form E) | Pearson |
| LEAP 2025 English II | $\begin{aligned} & \hline \text { NWT_7064 (Form A - AE) } \\ & \text { RST_VH004490 (Form A - AE) } \\ & \hline \end{aligned}$ | NWT_HH432845949 (Form E) RST_HH607742252 (Form E) | Pearson |
| LEAP 2025 Algebra I | All CRs | N/A |  |
| LEAP 2025 Geometry | All CRs | N/A |  |
| LEAP 2025 Biology | All CRs and ERs | N/A |  |
| LEAP 2025 U.S. History | All CRs, ER (AE form) | ER (operational) | Measurement Inc. |
| Note: All Administrative Error [AE] form items are handscored by DRC scoring supervisors. |  |  |  |
| * DRC's handscoring teams will provide a second read for at least ten percent of all Al-scored responses. |  |  |  |

LEAP 2025 Grades 3-8

| Test | Handscoring Only | Al Scoring* | Al Vendor |
| :--- | :--- | :--- | :--- |
| ELA grade 3 | Both PCRs | N/A |  |
| ELA grade 4 | Both PCRs | N/A |  |
| ELA grade 5 | RST_ VH198972/915510 | LAT_VF821667/801310 | Pearson |
| ELA grade 6 | N/A | Both PCRs | Pearson |
| ELA grade 7 | N/A | Both PCRs | Pearson |
| ELA grade 8 | N/A | Both PCRs | Pearson |
| Math grades 3-8 | All CRs | N/A |  |
| Science grades 3-8 | All CRs and ERs | N/A |  |
| Social Studies grades 3 and 4 | All CRs | N/A | Measurement Inc. |
| Social Studies grades 5-8 | All CRs | All ERs |  |
| *DRC's handscoring teams will provide a second read for at least ten percent of all Al-scored responses. |  |  |  |

## Handscoring Rules

## Al Scoring

For the LEAP 2025 U.S. History ER and grades 5-8 Social Studies items, Measurement Incorporated's (MI) Project Essay Grade (PEG) Al scoring system will provide the first score (the score of record). For select CRs in LEAP 2025 English I, English II, and grades 5-8 ELA, Pearson's Intelligent Essay Assessor (IEA) will provide the first score (the score of record). DRC's handscoring teams will provide a second read for at least ten percent of these responses in order to capture the inter-rater reliability statistics that will be used to manage scoring consistency of both the Al scoring systems and the handscoring teams. Scoring Directors will also review nonscores, alerts, and flagged responses as required. (For additional information about the nonscore, alert, and flagged response review process, please see the Handling Unusual Responses section starting on page 25.) The Al scoring process is discussed in-depth later in this document.

## Handscoring

All scores for handscored items (noted as Handscoring Only in the Spring 2021 Scoring Plan) will be provided by DRC's handscoring team. The score associated with the first scorer will be the score of record. Ten percent of the responses will be scored twice to monitor and maintain inter-rater reliability. Scoring Directors will review all nonscores and alerts.

In addition, per PARCC/Pearson rules for ELA and math, if the first two scores are nonadjacent (e.g., 0 , 2), a third, independent reading by a Team Leader or Scoring Director will be conducted for additional quality control monitoring. In the unlikely event that a response receives three nonadjacent scores (i.e., $0,2,4)$, a Scoring Director or Project Manager will review the response and provide retraining as needed.

## Calculating the Final Score:

- The score associated with the first scorer is always the score of record, regardless of how many subsequent scores are applied.
- After handscoring, when the final score-processing for the ELA items takes place, the Written Expression trait score is multiplied by 3 (for the Narrative Writing Task). The Reading Comprehension and Written Expression (RCWE) trait score is multiplied by 4 (for the Literary Analysis and Research Simulation tasks), and one fourth of this weighted score will be assigned as the Reading Comprehension score, and three fourths of this weighted score will be assigned as the Written Expression score. The Knowledge and Use of Language Conventions score is not weighted.

Page 19
6.4.21 | DRC Proprietary and Confidential

## Reader Monitoring Procedures

## Team Leader Read-Behinds

Throughout the handscoring process, DRC Project Managers, Scoring Directors, and Team Leaders will review the statistics that are generated on a daily basis. DRC will assign one Team Leader for approximately every 10 readers. (When test numbers are low and smaller groups totaling 10 or fewer readers are used, these groups may be supervised directly by the Scoring Director.) If scoring patterns are apparent among individual scorers, Team Leaders or Scoring Directors will handle these issues on an individual basis. If a scorer appears to need clarification of the scoring rules, DRC supervisors typically monitor one out of five of the scorer's readings, making adjustments to that ratio as needed. If a supervisor disagrees with a reader's scores during monitoring, he or she will correct the score and provide retraining in the form of direct feedback to the reader, using rubric language and applicable training responses. The supervisor's corrected score becomes the score of record; it is not a second read.

DRC will also monitor the inter-rater reliability, which is to be based on the $10 \%$ of responses that receive second reads. If a scorer falls below the expected rate of agreement, the Team Leader or Scoring Director will retrain the scorer. If a scorer fails to improve after retraining and feedback, DRC will remove the scorer from the project. In this situation, DRC will remove all unreported scores that were assigned by the scorer during the period in question. These unreported responses with dropped scores will then be re-dealt and rescored.

## Validity Sets and Inter-Rater Reliability

In addition to the feedback that supervisors provide to readers based on regular read-behinds and the continuous monitoring of inter-rater reliability and score point distributions, DRC will also conduct validity scoring using PARCC-approved validity responses supplied by New Meridian (for ELA and math) as well as LDOE-approved validity responses identified by DRC scoring supervisors for DRC-developed math items and WestEd-developed Biology, U.S. History, and grades 3-8 Science and Social Studies items. The validity responses that will be used in spring of 2021 are the same ones that were used when these items were previously administered and scored by DRC.

The validity responses will be added to DRC's image handscoring system prior to the beginning of scoring. The distribution of validity responses will be more frequent at the beginning of the scoring window and will decrease as agreement levels reveal a strong understanding and application of the scoring guidelines by the scorers. Validity reports compare scorers' scores to pre-determined scores and can help detect potential group drift as well as individual scorer drift. This data will be used to make decisions regarding the retraining and/or release of scorers, as well as the rescoring of responses.

To monitor inter-rater reliability, DRC will produce handscoring quality control reports on a daily basis (see samples on pages 23-24) that provide exact, adjacent, and nonadjacent agreement rates for each reader and item on a daily and cumulative basis. These rates are calculated based on responses that are scored by two readers (or PEG or IEA—the AI scoring systems—and one reader). MI's PEG AI scoring

Page 20
6.4.21 | DRC Proprietary and Confidential
system will provide the first scores (the scores of record) for the LEAP 2025 U.S. History and grades 5-8 Social Studies operational ERs. For select CRs in LEAP 2025 English I, English II, and grades 5-8 ELA (see Spring 2021 Scoring Plan), Pearson's IEA will provide the first score (the score of record). This data will be used in conjunction with scores from human-conducted second reads to calculate inter-rater reliability statistics in these content areas. Metrics and standards associated with the two Al scoring systems and their processes are described in the Al Scoring section starting on page 27 . Al scores will be attributed to reader ID number 3 in the appropriate scoring reports. The calculations on these reports are:

- Percent Exact (\%EX) -total number of responses by reader where scores are the same, divided by the number of responses that were scored twice
- Percent Adjacent (\%AD) -total number of responses by reader where scores are one point apart, divided by the number of responses that were scored twice
- Percent Non-Adjacent (\%NA) - total number of responses by reader where scores are more than one score point apart, divided by the number of responses that were scored twice

DRC will strive to maintain the inter-rater and validity exact agreement rates at or above the percentages noted in the table, Agreement Rate Expectations for Validity and Inter-Rater Reliability, on page 22. When a reader's validity or inter-rater agreement falls 5\% or more below these expectations, or if Perfect Agreement + Adjacent percentages fall below the rates noted, the reader will be flagged for additional monitoring and/or retraining by their Team Leader or Scoring Director. Additionally, for all items which will be Al scored, low inter-rater reliability will be investigated to see if it is an indication that the handscorers need retraining or if the AI needs retraining (see the AI Scoring section for details about Al training).

The validity and inter-rater reliability expectations for LEAP 2025 items are shown below.

| Agreement Rate Expectations for Validity and Inter-Rater Reliability LEAP 2025 |  |  |  |
| :---: | :---: | :---: | :---: |
| Content Area/Course | Score Point Range | Perfect <br> Agreement | Perfect <br> Agreement + <br> Adjacent |
| English I, English II, Grades 3-8 ELA | 0-3 or 0-4 Rubric, Multi-trait | 65\% (each trait) | 96\% (each trait) |
| Algebra I, Geometry, Grades 3-8 Math | 0-1 Rubric | 90\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-2 Rubric | 80\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-3 Rubric | 70\% | 95\% |
| Algebra I, Geometry, Grades 3-8 Math | 0-4 Rubric | 65\% | 95\% |
| Biology, Grades 3-8 Science CR items | 0-2 Rubric | 80\% | 95\% |
|  | 0-1 Rubric | 90\% | 100\% |
|  | 0-2 Rubric | 80\% | 95\% |
|  | 0-3 Rubric | 70\% | 95\% |
|  | 0-4 Rubric | 70\% | 95\% |
| (multi-part) ER items | 0-5 Rubric | 70\% | 95\% |
|  | 0-6 Rubric | 60\% | 93\% |
|  | 0-7 Rubric | 60\% | 93\% |
|  | 0-8 Rubric | 60\% | 90\% |
| Grades 3 and 4 Science <br> Comprehensive (single part) ER items | 0-6 Rubric | 60\% | 93\% |
| Biology, Grades 5-8 Science <br> Comprehensive (single part) ER items | 0-9 Rubric | 60\% | 90\% |
| U.S. History, Grades 3-8 Social Studies CR items | 0-2 | 80\% | 95\% |
| U.S. History, Grades 5-8 Social Studies 0-8 point, 2-dimension ER items (Content 0-4; Claims 0-4) | 0-4 (each trait) | 70\% | 95\% |

Each reader will be expected to maintain an acceptable level of exact agreement on validity responses and on inter-rater reliability as described above. Additionally, readers will be expected to maintain an acceptably low rate of nonadjacent agreement for validity and inter-rater agreement. To monitor this, we will sum each reader's percentages of exact and adjacent agreement rates and require each reader to maintain the levels displayed under "Perfect Agreement + Adjacent" in the table above.

Page 22

## Calibration Sets

Calibration sets are another means of ensuring consistency in scoring. DRC will use these sets to maintain calibration across the entire scorer population after breaks from scoring (e.g. weekends; down time between scoring periods; when moving between items/prompts). Calibration sets will also be used for an item if trends occur (e.g., low agreement between certain score points, if a certain type of response is missing from initial training).

The responses in these targeted sets help illustrate particular points and familiarize readers with the types of responses commonly seen during operational scoring. They were chosen by DRC scoring supervisors during live scoring or supplied by New Meridian (for ELA and math). After the readers score one of these calibration sets (usually 5-10 responses), the Scoring Director will review the set with the readers using rubric language and scoring concepts exemplified by the anchor responses to explain the reasoning behind each response's score. These sets do not have a passing requirement but are designed to help refocus readers on how to properly use the scoring guidelines to score responses. The Scoring Director or Team Leaders will provide individual feedback to any readers in need of additional clarification based on their performance.

## Handscoring Quality Control Reports

The Scoring Summary reports show inter-rater reliability data and score point distribution information for each item (by part where appropriate).

Scoring Summary Report Sample

| Inter-rater Reliability |  |  |  |  | Score Point Distribution |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\overrightarrow{0}$ | 2X \%EX \%AD \%NA |  |  |  | Total ${ }^{\prime} \%{ }^{\prime \prime} \% 1$ \%2 ${ }^{\text {\% }}$ \% 3 |  |  |  |  | \%B | \%F | \%N | \%R | \%T | U |
| Current Handscore | 636 | 87 | 13 | 0 | 2.440 | 62 | 26 | 3 | 0 | 0 | 0 | 3 | 0 | 0 | 3 |
| 3 | 318 | 87 | 13 | 0 | 2,122 | 63 | 27 | 3 | 0 | 0 | 0 | 2 | 0 | 0 | 2 |
| 11775 | 18 | 86 | 14 | 0 | 18 | 72 | 28 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 13021 | 36 | 81 | 19 |  | 36 | 64 | 31 | 0 | 0 | 0 | 0 | 0 | 6 | 0 | 0 |
| 16132 | 76 | 83 | 17 | 0 | 76 | 64 | 33 | 0 | 0 | 0 | 0 | 3 | 0 | 0 | 0 |

## Reader Feedback Logs

Reader performance and intervention information will be tracked and updated in bi-weekly Reader Feedback Logs. These Reader Feedback Logs provide at-a-glance information about retraining actions taken with individual readers to ensure scoring consistency in regard to reliability, score point distribution, and validity performance. The logs address the following possible actions:

- Action 1—Includes one or more of the following: increase monitor rate, show and discuss examples of errant scores, pair scorer with a supervisor or stronger reader, provide additional review or training materials/recalibration
- Action 2-Rescoring of responses for which scores have not been handed off for reporting
- Action 3-Removal from scoring item

Below is an example of a Reader Feedback log:

| Algebra I Q000 |  |  |  |  |  |  |  |  | M/D/Yr |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Reader | \%EX Low | \%NA High | Score Point Distribution Skewed | Validity \%EX Low | Validity \%NA High | Comments | Action 1 | Action 2 | Action 3 |
| 3782 |  |  |  | - |  |  | $\bullet$ |  |  |
| 12860 |  |  | $\bullet$ |  |  |  | $\bullet$ |  |  |
| 13296 |  |  |  | $\bullet$ |  |  | $\bullet$ |  |  |
| 16070 | $\bullet$ |  |  |  |  |  | $\bullet$ |  |  |
| 18961 |  |  |  | $\bullet$ |  |  | $\bullet$ |  |  |

## Handling Unusual Responses

## Nonscore Codes and Definitions

Handscored responses that cannot be assigned a score based on the rubric will be assigned a nonscore code. When readers apply nonscore codes, the responses are automatically routed to DRC handscoring supervisors for validation. Responses that receive a nonscore code count as zero points toward student scores that display on reports. The nonscore code will display in the response string that is included in the file provided to the LDOE.

The nonscore codes and the tests to which they apply are described below:
Nonscore Code Definitions

| Nonscore Code | Explanation |
| :---: | :--- |
| B | Blank/no response |
| F | Response is not written in English (Math responses from Spanish forms will <br> be scored by a Spanish-qualified math scorer.) |
| I | Response does not contain enough original writing to evaluate. There is an <br> insufficient amount of original writing to score and/or the response is <br> composed of copied text. (Insufficient also means copied text that may <br> have slight changes but does not introduce original ideas/thoughts.) |
| N | Don't understand/know |
| R | Refusal to respond |
| T | Off-topic |
| U | Incoherent, unintelligible, or undecipherable |

## Nonscore Codes by Test

| Test | B | F | I | N | R | T | U |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LEAP 2025 Algebra I, Geometry, English I, English <br> II, 3-8 ELA, and 3-8 Math | $\checkmark$ | $\checkmark$ | N/A | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| LEAP 2025 Biology, 3-8 Science, U.S. History, and <br> 3-8 Social Studies ERs and CRs | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | N/A | $\checkmark$ |

If readers suspect plagiarism but have no concrete evidence, they score the response and alert it for suspected plagiarism. These responses are sent to supervisors for additional investigation. When supervisors find evidence of student-student plagiarism, each of the associated responses is scored according to rubric requirements and processed as an alert. Responses with proven student-internet plagiarism receive a score of 0 and are also processed as alerts. If supervisors cannot find definitive proof of plagiarism in a response but suspect it to be likely, the response is scored using the rubric and processed as an alert. All responses with a possible plagiarism alert are sent to LDOE for final determination. (For additional information on processing of final alerts, see Alerts section on page 26).

#### Abstract

Alerts Scorers have the ability to apply an alert flag to specific student responses. These are responses that may indicate the possibility of teacher interference, plagiarism, or disturbing content (e.g., possible physical or emotional abuse, suicidal ideation, threats of harm to themselves or others, etc.). After setting the alert flag, which states the reason for the alert, and providing a brief description (as necessary), the reader will score the response according to the specific scoring guidelines for that item.

Likewise, PEG and IEA have the ability to detect specific alerts (described in detail later in the Artificial Intelligence Scoring section of this document). All alerted responses (whether identified by a human reader or by AI) are automatically routed to the Scoring Director who reviews the score and forwards appropriate responses (including grade, test, lithocode, item number, and reason for alert) to senior project staff and DRC's Project Management Team for review.

If it is concluded that a response warrants an alert, DRC Project Management will contact the LDOE with the student's LASID and post to the SFTP site the response information provided by the scoring staff for LDOE to review. If it is determined that a void is required due to plagiarism, the LDOE applies an invalidation to the record in eDIRECT. At no point during this process do scorers, Team Leaders, or Scoring Directors have access to demographic information for any students participating in the assessment. Note that the alert status of responses is not passed on in data files.

## Artificial Intelligence Scoring

As part of our comprehensive scoring solution, DRC uses two artificial intelligence (AI) scoring systems. Measurement Incorporated's (MI) Project Essay Grade (PEG) is used to score students' responses to the writing prompt for the extended-response items (ER) for LEAP 2025 U.S. History and grades 5-8 Social Studies. Pearson's Intelligent Essay Assessor (IEA) is used to score student responses to selected constructed-response (CR) items in grades 5-8 ELA, English I, and English II.

## Al Scoring - Measurement, Inc.

The items in the following table will be Al scored by MI during the spring 2021 administration. The AI scoring models were built by MI and followed the model-building process described below. (Modelbuilding data for all items included on the spring 2021 test may be found in the Appendix.)

| Test | Item Type | IDEAS ID | Model Built |
| :--- | :--- | :--- | :--- |
| LEAP 2025 U.S. History | ER | 892955 | Fall 2017 |
| LEAP 2025 Grade 5 Social Studies | ER | $807773^{* *}$ | Fall 2016 |
| LEAP 2025 Grade 6 Social Studies | ER | $804889^{*}$ | Fall 2016 |
| LEAP 2025 Grade 7 Social Studies | ER | $805627^{*}$ | Fall 2016 |
| LEAP 2025 Grade 8 Social Studies | ER | $808905^{*}$ | Fall 2016 |

*In spring 2017, human scored targeted samples of $\approx 500$ responses per item used to augment and retrain the original Al models built in 2016. These samples were intended to find high score points to add to the existing Al models for the purpose of retraining the models prior to operational scoring in spring 2017.
**The original 2016 model for grade 5 ER 807773 was similarly augmented prior to operational scoring in spring 2019 using a targeted sample of spring 2019 responses.

## Model Building

To build the model, PEG analyzed a set of inputs that were randomly pulled from the training set itself, which was made up of approximately 2,500 examples of student field test responses scored by expert human scorers. Specifically, the training set was divided into two independent pieces:

- One set of response data was used to train the Al engine and produce the scoring model. This attributed to $85 \%$ of the training set ( $\sim 2,125$ responses).
- The remaining $15 \%$ of the training set ( $\sim 375$ responses) was then used to validate the resulting model.

A regression model was built by choosing a set of variables useful for determining the accuracy/suitability of the response and using least squares Linear Regression to find a best-fit relationship based on the training set. An algorithm chose the initial set of variables and added to the set as needed to produce a good fit, by taking into account correlation statistics and multicollinearity. Once the model was built, it was then run against the validation set, so that it could be evaluated for accuracy. Training was complete once PEG's validation set scores agreed with the human scores; however, if this level of accuracy was not met, then further iterations of training (which may involve

Page 27
6.4.21 | DRC Proprietary and Confidential
new parameterizations or new algorithms) were used to produce a different model with higher accuracy. This process was completed for each trait that needed to be scored.

To further understand the importance of the validation set, consider that one of the risks inherent in machine learning is over-fitting the data. This means that it is possible to home in on particular elements of the responses in training data in such a way that the model does not generalize well to unseen data. To mitigate this risk, PEG uses a hold-out validation strategy ${ }^{2}$ in which a randomly chosen subset of the initial training data is set aside, never used in training, but used only to evaluate the generalizability of models trained from the remainder of the set.

Validation is implicit in PEG's model training and, therefore, is complete for any model in production. The essential element of the process is that the models are trained on a larger subset of the training sample (approximately $85 \%$ ), then validated against an entirely separate smaller subset of the training sample (approximately $15 \%$ ). What is critical about this process and all validation schemes used in PEG training is that the Al's agreement is always based upon samples the AI has not encountered during training. Put another way, the samples used to train are never the same as the samples used to validate. This maximizes generalizability and minimizes the chance for over-fitting.

## Evaluation Metric

When PEG builds a model, it selects the model elements that maximize scoring accuracy for the data in question. Therefore, it is important to choose an agreement statistic on which PEG can optimize its models in such a way that the final model will exhibit reliable, accurate scoring. The inter-rater reliability of two human raters is often measured via perfect/adjacent agreement or the Pearson product-moment correlation coefficient (Pearson's $r$ ). However, these two metrics each have significant disadvantages. Perfect/adjacent agreement is highly influenced by the overall scale and underlying distribution of the "true" scores (Williamson \& Breyer, 2012), while Pearson's $r$ is insensitive to mean difference between raters (Schuster, 2004).

MI has found that using quadratic weighted kappa, which has become the industry standard for Al scoring, as the optimization and evaluation metric leads to the most reliable and accurate scoring. Quadratic weighted kappa as a metric can detect changes in mean difference and variance between raters and is therefore well suited for comparing the accuracy of AI scoring with that of human scoring, as well as measuring the agreement of two independent human raters. For the sake of clarity in the discussion below, the quadratic weighted kappa between PEG and Reader 1 is referred to as $\kappa \omega$ (PEG, $R 1$ ) and quadratic weighted kappa between Reader 1 and Reader 2 is referred to as $\kappa \omega(R 1, R 2)$.

[^2]Page 28

Even though quadratic weighted kappa performs well as an optimization metric, there are still some deficiencies in using it as an evaluation metric. Quadratic weighted kappa is far less influenced by the overall scale and underlying distribution of the "true" scores than perfect/adjacent agreement, but it does still display some sensitivity to those aspects of the data. In addition, while Al scoring can outperform human scoring with regard to scoring accuracy, the quality of the human scoring data has a significant impact on PEG's ability to accurately model the data. That is, a low $K \omega(R 1, R 2)$ will usually lead to a low $\kappa \omega($ PEG, R1). Because of these issues with sensitivity to scale and distribution of scores and being bound by the quality of the training data scores themselves, it is difficult to give a fixed number in all scales for what an acceptable value would be for $\kappa \omega$ (PEG, R1). In cases of four or more levels (e.g. a score ranging from 1-4, or broader) a $\kappa \omega$ (PEG, R1) of 0.7 has become a rule of thumb as a go-no-go metric. In these broader scales, a $\kappa \omega$ (PEG, R1) that is less than 0.7 to any significant degree is typically grounds for rejecting the item for Al scoring. In cases where this metric is 0.7 or above, the performance is usually considered satisfactory for Al scoring; however, other metrics such as those discussed in the next paragraph are often considered for additional information.

For instance, where the score range is smaller, such as binary (0-1) or ternary (0-2) ranges, the QWK is of more limited use, as QWK subtracts the rate of chance agreement which is quite high in the binary and ternary cases. In binary and ternary cases, the percent-exact and percent-adjacent agreements can be valuable additional metrics as they are exhaustive in these extremely-limited-range cases. Also useful in such extreme cases is to compare the human-machine agreement with the human-human agreement. In these cases the difference between $\kappa \omega$ (PEG, R1) and $\kappa \omega$ (R1, R2) can be used as an additional evaluation metric. MI defines that value as follows:

$$
\Delta \kappa=\kappa \omega(\text { PEG, R1 })-\kappa \omega(R 1, R 2)
$$

When $\Delta k$ is positive, PEG's scores are more in agreement with Reader 1 than Reader 1's scores are in agreement with Reader 2 . When $\Delta \kappa$ is negative, the opposite is true; Reader 1 and Reader 2 show higher agreement levels than PEG and Reader 1. Of course, in both cases the absolute value of $\Delta k$ maintains its weight as a relative value between the two kappa values. That is, a larger $\Delta k$ means more separation between the two kappa values being compared.

The first phase of training is to maximize agreement between the PEG (machine) score and the final expert human score. If high agreement can be reached in this phase (for instance, a quadratic weighted kappa of $\geq 0.7$ ), then the model is considered fit. The PEG team conducts secondary analysis such as this R1 vs. R2 analysis in cases where there is some question as to the fitness of the model - for instance, in a case in which PEG's quadratic weighted kappas are quite low, R1 vs. R2 analysis may be conducted to determine if the lack of agreement is a shortcoming of PEG's training, or if it is implicit in the data. This was not necessary in the current set.
$\Delta \kappa$ is a good metric to quickly show how accurately PEG was able to score a set of data with respect to how accurate human raters are on the same data, but MI also reports other metrics that its clients may be more familiar with, such as perfect/adjacent agreement, Pearson's r, and standard mean difference. However, since PEG was optimized on quadratic weighted kappa, $\kappa \omega$ and $\Delta \kappa$ are the best reflections of actual performance.

## Scoring Responses with the Al Engine

The PEG AI scoring engine extracts and uses a large and proprietary set of linguistic feature metrics both during training and during production scoring. During training, PEG's models "learn" to represent the many complex and almost always non-linear relationships found between these linguistic features and the score points assigned by human experts. During production scoring, these same features are extracted from submitted responses. The previously trained models related to the item in question are then used to map these features to their predicted score points.

After PEG has been trained on a scored training set provided by DRC, it is available to receive batches of student responses in a mutually agreed upon format (XML or plain-text). The current preferred scoring method is to exchange XML documents via a web service. No static files are exchanged during this process. The web service supports discovery via Web Service Description Language (WSDL). The file transfer will be encrypted and will satisfy FERPA security requirements. Each record in the batch provides PEG with the student's response and a number of identifiers. The identifiers typically consist of a test ID that uniquely identifies the test, an item ID that uniquely identifies the item, and a FERPAcompliant student ID that uniquely identifies either the student or the student-test combination. The tables in Section 2 of the "DRC - Streaming Scoring" document (see Appendix) also contain information on identifiers.

When PEG receives the file, it processes the batch of responses and records the scores. Each record is specific to a student-test-item combination and will contain the item's score or a reason why it could not be scored (most commonly because the response is too short, or does not contain English). After the batch is processed, the scored records will be returned to DRC for reporting.

DRC will send files to MI daily. Scored files will typically be returned to DRC in 2 to 3 days; however, these timeframes are not definite, because they are dependent on numerous variables involved (e.g. number of responses submitted, number of different items, number of traits per item, the average response length, the standard deviation of response lengths, number of unique words submitted in each response, etc.).

Regardless of whether responses are scored by humans or machines, it is inevitable that scoring anomalies requiring human intervention will occur. Built into MI's automated scoring engine are a variety of triggers for identifying alert papers and responses in which it has low confidence. This is detailed later under "Identifying Responses for Human Review."

## Quality Control of the AI Engine

The guidelines below are purposefully general as they have proven to be the best practice for training the PEG engine. The PEG team followed this standard procedure in the DRC/Louisiana project and attempted to maximize human-machine quadratic weighted kappa among all holdout sets.

PEG holds out a $15 \%$ set of training data for use in validation. This holdout set is not seen by the Al during training. Instead, once training is complete, the holdout set is submitted for test evaluation and PEG's output is compared to the known, human-expert scores. As discussed in "Evaluation Metric"

Page 30
above, the quadratic weighted kappa has proven to be the most valuable agreement metric in PEG's recent history; however, others (e.g., exact, adjacent, and any host of others) are also applicable.

This evaluation was performed along with model building prior to operational scoring, and the results were shared with LDOE and the TAC to demonstrate sufficient scoring accuracy by PEG. For details on these results, please see Appendix C.

Once training and model building is complete, the performance of any given model is essentially deterministic (so, for a precise, given input, the output is expected to be identical). The PEG team monitors the services for unexpected events (for instance physical damage to its cloud infrastructure), and handles any data flow issues (for instance, if the client was using a different item number during live scoring than was used during training) but the Al itself does not change during live scoring. When readbehind data becomes available to the PEG team (typically this is on an annual basis), it can be used to reevaluate and, if necessary, retrain the existing models prior to the next season of use, but such changes do not happen during live scoring. As part of our continuous improvement cycle, the analysis of this data is on-going with no current end date (i.e., items are being reviewed on a rolling basis).

## Identifying Responses for Human Review

Built into $\mathrm{MI}^{\prime}$ s automated scoring engine are a variety of triggers for identifying responses that require human review, including potential alerts (suspected plagiarism included) and potential nonscorable responses (e.g., responses that are primarily copied text, lack proper development, lack enough content to be scored, or are written in an unsupported language). Many of these triggers have clientconfigurable thresholds. These can be set to standard defaults and then modified as needed. Thresholds are generally deliberately conservative. DRC will work with LDOE content staff and MI to look at the responses that PEG identifies for human review to make sure the high and low copied text and minimum word count settings are set appropriately. (See page 28 for detailed information about these custom thresholds.)

Please note that all responses that are identified in the sections below for human review will be automatically forwarded to a DRC Scoring Director who will determine the correct score or nonscore code to apply to the response. The Scoring Director will provide the final, reported score (or nonscore) for these responses. If the Scoring Director needs assistance in determining the correct score or nonscore, DRC will work with LDOE content staff to ensure that the response is scored correctly.

## Alert Detection System

PEG has a robust system for detecting potential alerts, which is described in detail in this section. When PEG detects the presence of alert language, this alone does not indicate that a response is unscorable. Therefore, unless the response is unscorable for some other reason, PEG will return scores as well as the alert status code of 500 (in cases of unscorable alerts, the status code is in the range of 501-599, inclusive). Regardless of the alert flag, any responses returned with a flag to DRC will be evaluated by the handscoring supervisory team, who will determine if the response needs to be processed as an alert as described previously in this document (see Handling Unusual Responses - Alerts). When it is concluded that a response does warrant an alert, DRC Project Management will contact the LDOE with the student's LASID and post the response information to the SFTP site for LDOE's review.

Page 31
6.4.21 | DRC Proprietary and Confidential

PEG's Alert flagging system is a pattern-matching system, targeting phrases suggestive of violence towards self or others, drug or alcohol abuse, feelings of anxiety or depression or the use of weapons. This system is rules-based. It responds to concentrations of "alert language" detected within submissions. Typically, these are word counts of particularly violent or profane language often found in actionable alerts. (Such language may also be found in non-alert submissions, but PEG does not attempt to determine "intent" in these cases, rather it flags only the presence of detected verbiage.) PEG currently tracks two types of alert language that differ only in severity (e.g., a statement regarding a person "killing" is considered more severe than a statement regarding a person "beating up," but both are counted as forms of alert language). By default, PEG issues an alert flag if it encounters one instance of severe alert language or two instances of less-severe language. PEG may also issue an alert flag if high counts of profanity are found. By default, this is three instances of severely profane or five instances of less profane verbiage. Although this means that non-actionable alerts may also certainly be flagged, PEG's default settings are purposefully kept highly sensitive to alert language. These levels are configurable, however, so if the rate of return is too high or too low, adjustments can be made. For the responses that it cannot score, PEG returns a condition code to the test delivery system indicating why the response could not be scored (i.e., the response receives a tentative nonscore code that is reviewed by a Scoring Director and corrected if needed). The test delivery system can then route the flagged responses to DRC's performance assessment handscoring system. DRC will perform human handscoring for the limited number of responses that cannot be scored by AI.

With regards to the process and timing, the alerts detection is typically run in series with other essay analysis, so it is no slower (or faster) than a regular scoring. A batch of individually identified extended responses are posted to PEG's Streaming Scoring service, and at that point a response may be flagged as a potential alert. This flag takes the form of a "status code."

The rules are purposefully over-sensitive (they are more likely to give false positives than false negatives), so it is likely that the great majority of ER's flagged with a " $5 \# \#$ " status code will not require actual intervention; however, PEG is in no way capable of diagnosing this. Instead PEG just follows rules designed to sense and flag the use of language which has, in the past, been associated with alerts.

## Identification of Nonscorable Responses

PEG's nonscorable configurability includes the settings listed below, which can flag responses so that they are sent to DRC Scoring Directors who will determine the correct score or nonscore code to apply. These can be set to any threshold, with extreme values effectively disabling any given setting. These are the only nonscorable parameters which can be configured in this way. Each nonscorable setting relates to status codes and general rules surrounding of insufficiency and indecipherability as described below.

1. MIN_WORDS: this controls status code 200 and may correspond to the business concept of "Insufficient" (i.e., too-short response)
2. MIN_CORRECT_WORD: this controls the status code 220 and is similar to the business concept of "Indecipherable" (i.e., foreign words and non-words)
3. Copied Text Low: this controls status code 605
4. Copied Text High: this controls status code 610

By adjusting each setting, PEG may impose a reasonable approximation of the scoring rules regarding Insufficiency and/or Indecipherability.

Once the scoring in the cloud is complete, the scores and statuses are sent back to the MI Delivery Service which then returns these scores and codes to DRC.

That entire process typically requires less than 100 hours ( $\sim 4$ days), and quite often takes less than a single day.

## Identifying Copied Text and Plagiarism with the AI Engine

Prior to describing the functionality PEG uses to detect copied text and plagiarized responses, an important distinction must be made between what is considered copied and what is considered plagiarized. Copied text is that which a student copies from the directions, prompt, passage(s), or reference sources supplied with an item. A response composed predominantly of text copied from item sources will not be alerted for any sort of suspected testing violation, but in most cases, it will receive a lower score (or a nonscore of "I") depending on the amount of original student writing in the response and/or how much text is copied. Responses flagged by PEG for this condition are sent to DRC scoring supervisors for review. Based on this review, any U.S. History and Social Studies grades 5-8 response having an insufficient amount of original writing to score, because it is made up entirely or almost entirely of text copied from the directions or reference sources, will receive a score of "I."

Text that a student extracts and uses from a source external to the test itself is considered plagiarized. When PEG detects these responses (this process is explained in the next paragraph), they are also sent to DRC scoring supervisors for review, and if they are deemed to warrant an alert for suspected plagiarism, DRC's supervisors route the responses through the same alert process described in an earlier section of this document (Handling Unusual Responses - Alerts).

PEG's copied text and plagiarism detection functionality compares student responses to texts that students may have copied or plagiarized. To do this, per-item reference texts must be provided. For the LEAP 2025 U.S. History and Social Studies grades 5-8 ER item, this includes the prompt and associated source material (including MC/MS items) provided with the item. DRC also pre-identified websites that may be likely sources of external plagiarism. These include Wikipedia pages relevant to the topic and/or other "top hit" websites. These external sources will be used by the AI engine to identify potentially plagiarized responses. These text references have been added to the scoring model.

Upon receiving a response, PEG conducts a high-speed sequence scan of both the reference text and the response. Each sequence is evaluated for both the length and density of copied/plagiarized text. Length is a direct character count, and density is a measure of similarity between sequences. A verbatim copy has a density of 1.0, and a copy that contains some substitutions, additions, or deletions would likely have a density in the $\sim 0.6-0.4$ range. The product of these two numbers provides a value that is used to flag responses requiring human review due to large amounts of copied/plagiarized text. Clients can configure two thresholds for a low and high flag. For example, the default values for these are 50 and 100 respectively. So, a verbatim copy of 72 characters ( $\sim 12$ prompt words) would be reported as a low match, whereas a verbatim copy of 100 characters (roughly 16 words) would be flagged as a high match.

Page 33
6.4.21 | DRC Proprietary and Confidential

Similarly, a copy (even with some substitutions) of 40 words would still be reported as a high match in the default setting example. The low and high matches will be flagged with status codes. This is similar to the alert flagging above. There will be a three-digit code for low-match (status code 605) and a threedigit code for high-match (status code 610).

Custom thresholds for copied text, plagiarism, and insufficient responses have been established by DRC in consultation with LDOE and were based on recommendations from MI. They are described below:

1. When PEG scans responses for copied text/plagiarism, any text copied from the supplied reference texts (regardless of whether it is contained within quotations marks) will be considered when determining if a response meets or exceeds the thresholds required for it to be routed to DRC for human review. These configurations are noted in $2 \mathrm{a}-3 \mathrm{~b}$ below.
2. LEAP 2025 Grades 5-8 Social Studies
a. Copied text thresholds
i. Low flag (status 605) -125 characters
ii. High flag (status 610) -200 characters
b. MIN_WORDS (status 200) - 25 words or fewer
3. LEAP 2025 U.S. History
a. Copied/plagiarized text thresholds
i. Low flag (status 605) - 85 characters
ii. High flag (status 610) -170 characters
b. MIN_WORDS (status 200) - 25 words or fewer

These settings are deliberately conservative. While some flagged responses are composed exclusively of text copied directly from source/passage material, the majority of responses that PEG flags with status codes 605 and 610 contain a combination of copied text, relevant information cited or paraphrased from the sources, and some amount of original student writing. They are flagged because they meet or exceed the copied text thresholds noted above and need to be checked by DRC scoring supervisors to determine whether they contain a sufficient amount of original student writing to evaluate. Upon review, most will be found to contain enough original writing to be considered scorable. When the supervisor determines that there is sufficient original student writing to score, and there is no evidence of plagiarism, he or she validates the original numeric scores returned by PEG and they are submitted as final scores for that response. On the other hand, if the supervisor determines that the response contains insufficient original student writing to evaluate, he or she will override PEG's scores and apply the appropriate scores or nonscores as necessary. For LEAP 2025 U.S. History and Social Studies, flagged responses composed entirely of text copied from item source material (or copied text combined with an insufficient amount of original student work) are given a nonscore of "I" (Insufficient).

Less frequently, responses will be flagged as potential nonscores for having too little written to be evaluated at all (status code 200). Just as DRC requires all nonscores given by human readers be reviewed by scoring supervisors, this same requirement holds true when PEG flags responses as potential nonscores. For example, if the DRC supervisor reviews a response flagged by PEG and agrees

Page 34
6.4.21 | DRC Proprietary and Confidential
with PEG's assessment that the response has too little writing to be assessed, the supervisor will validate the AI score of "I," and this nonscore code will be submitted as the final score for that response. On the other hand, if DRC's supervisor reviews the response, and based on the training responses provided in the handscoring training materials, he or she feels that that there is enough original student writing to score, the supervisor scores the response and also overrides PEG's original nonscore, changing PEG's nonscore of " $I$ " to the correct numeric scores. These become the scores of record.

## Al Scoring - Pearson

The items in the following table will be AI scored by Pearson during the spring 2021 administration of LEAP 2025. (Model-building data for all items included on the spring 2021 test may be found in the Appendix.)

| Test | Task <br> Type | IDEAS ID | PARCC UIN | Model Built |
| :--- | :--- | :--- | :--- | :--- |

| Grade 8 ELA | RST | 982327 | FF506834510 | 2021 |

## The Intelligent Essay Assessor

Pearson's Intelligent Essay Assessor (IEA) uses a range of machine learning and natural language processing technologies to learn to score based on human-scored responses. One of the hallmarks of IEA is its ability to score constructed responses in content domains using Pearson's unique implementation of Latent Semantic Analysis (LSA), an approach that generates semantic similarity of words and passages by analyzing large bodies of relevant text. LSA can then "understand" the meaning of text much the same as a human scorer.

IEA's background knowledge of English is derived from a collection of texts equivalent to what students are likely to have encountered over the course of their academic career (about 12 million words). Because LSA operates over the semantic representation of texts, rather than at the individual word level, it can evaluate similarity even when texts have few words in common. For example, LSA finds the following two sentences to have a high degree of semantic similarity even though they have no words in common:

- Surgery is often performed by a team of doctors.
- On many occasions, several physicians are involved in an operation.

The following figure illustrates some of the features used in IEA and how they relate to specific constructs of student writing performance.

Example features used in the Intelligent Essay Assessor. Like human scorers, IEA evaluates essays for ideas, organization, development, and various grammatical and mechanics errors.

IEA is trained to associate features extracted from each essay with scores assigned by human scorers. A machine learning-based approach is used to determine the optimal set of features, and the weights for each of those features, to best model the scores for each essay. From these comparisons, IEA derives a prompt- and trait-specific scoring model that predicts the scores human scorers would assign to any new responses.

The automated scoring process mimics the approach that human scorers take when evaluating essays. Human scorers train based on anchors of annotated student responses with agreed-upon scores. Human scorers compare new responses against the anchor set of two to three examples per score point to determine the appropriate score. IEA scores essays similarly, but makes comparisons against a much larger set of examples. Rather than comparing a new essay against the 16-24 examples in an anchor set, it compares against the set of hundreds or thousands of responses on which it was trained.

Page 37

## How the Intelligent Essay Assessor was Trained

For most of the ELA prompts that will be scored using AI, IEA was trained based on operational PARCC responses using Pearson's Continuous Flow approach to training and scoring. When these prompts were first administered, student responses flowed to IEA even before human scoring started. IEA then selected a sample of responses for humans to score first to expedite the creation of automated scoring models. The sample included responses that represented different demographic subgroups to ensure equity in scoring, as well as responses that were algorithmically selected to likely span the score range. As the human-scored responses flowed back to IEA, the engine automatically built potential scoring models, evaluating them against the industry standards for performance criteria included in the table below.

| Evaluation of Automated Scoring Systems |  |
| :--- | :--- |
| Criterion | Threshold |
| Quadratic weighted kappa (QWK) | Greater than or equal to 0.70 |
| Pearson correlation (r) | Greater than or equal to 0.70 |
| Standardized mean difference (SMD) between human and <br> automated scoring | Less than or equal tol0.15। |
| Difference in QWK or r from human-human rates | Less than or equal to 0.10 |
| Difference in exact agreement from human-human rates | Less than or equal to 0.0525 |

Evaluating Automated Scoring. Statistical Criteria for the Evaluation of Automated Scoring Systems based on those used by Williamson et al, Smarter Balanced, and PARCC.

While the engine was being trained, scoring and psychometrics teams met daily to review progress, quality, and next steps. When IEA met or exceeded the performance criteria for a given constructed response item, it took over as the first scorer for that item.

For the four prompts that were trained in 2021 (see prompt table on page 36), responses and DRC human scores from the spring 2019 administration of LEAP 2025 (rather than a prior PARCC administration) provided the inputs to training. A sample of approximately 6,000 responses representing the operational score distribution was selected for each prompt. Approximately two-thirds of those responses were used to train IEA and the remaining one-third were held out for evaluation. Performance on the evaluation set was measured using the same criteria as the PARCC-based prompts.

Responses for which IEA is less confident in its scores are routed for additional human scoring. This "smart routing" of responses by the scoring engine occurs when responses fall in a particular score range for which the engine has lower agreement with human scorers, or for responses that are highly unusual or creative.

The figure below depicts the entire Continuous Flow process.

## Continuous Flow Scoring

Continuous Flow. As student responses flowed to IEA, it selected responses for human scorers to score. As the human scores flowed back to IEA, the engine continued to try to build a scoring model that would pass the agreed upon performance criteria. Once the scoring model passed the criteria, it was deployed and began scoring all student responses, with humans applying a second score as a quality check, as well as scoring any responses flagged for review by IEA.

IEA is also trained to recognize a variety of different non-responses (e.g., non-English language, "don't understand," refusal to answer, off-topic, unintelligible), assigning corresponding condition codes to them or flagging them for human review when less certain. Detection of copying between students is done out of band and accomplished by using Latent Semantic Analysis to compare each student response to every other student response and flagging highly similar responses for human review. The comparison is cumulative. Every response gets checked against every other response that has been received, as they come in, within that same administration and within that prompt. Disturbing content alerts are also scanned for out of band and flagged for human review.

## Quality Monitoring

Human scorers play a key role in maintaining quality throughout the scoring process starting with IEA learning to score based on their scores. Since the models for the 2021 Louisiana items are built and IEA has already established the performance characteristics necessary to accomplish first scoring, DRC human scorers will score $10 \%$ of the responses scored by IEA to monitor quality. Should agreement rates between IEA and the human scorers fall below the established agreement rates, the automated scoring

Page 39
6.4.21 | DRC Proprietary and Confidential
model can be examined to determine the appropriate action. This action may include adjusting IEA's confidence threshold to send more responses for human scoring or retraining the scoring engine and rescoring student responses.

## Scoring (DRC)

DRC will use human scorers to read behind MI and Pearson's AI engines. Ten percent of the AI-scored student responses will be randomly selected to be read a second time by DRC's handscoring teams. This will provide inter-rater reliability statistics that compare the scores given by PEG and IEA to the scores given by each individual reader. Throughout the handscoring process, DRC Project Managers, Scoring Directors, and Team Leaders will review handscoring reports detailing these results.

If the inter-rater reliability (Al compared to handscoring on the $10 \%$ sample) shows exact agreement that is less than desired or nonadjacent agreement that is higher than desired, DRC will investigate and take immediate action. If scoring patterns are apparent among individual readers, scoring supervisors will deal with issues of this sort on an individual basis. If a reader appears to need clarification of the scoring rules, DRC supervisors typically monitor one out of five of the scorer's readings, making adjustments to that ratio as needed. If a supervisor disagrees with a reader's scores during monitoring, he or she will provide retraining in the form of direct feedback to the reader, using rubric language and applicable training responses.

If, however, the agreement rates for either PEG or IEA and for large numbers of readers are not as anticipated, DRC scoring experts will need to review the responses that received different scores from the Al engine(s) and from readers. Based on this, the DRC scoring experts will need to determine if they feel that the readers need to be retrained or if they are disagreeing with scores given by AI. In the unlikely scenario that DRC's scoring experts believe that they have detected unexpected trends in the scores given by PEG or IEA, DRC would take examples to LDOE and the appropriate AI vendor to review. Based on this review, if DRC, LDOE, and the vendor determined that the AI modelling was not resulting in sufficiently accurate scores, corrective measures would be put into place. Depending on the nature and timing of the issue and subsequent related LDOE policy decisions, DRC and the AI vendor will enact measures such as updating the AI modeling, providing LDOE with response information (e.g., Item ID, Student IDs, updated scale scores, updated achievement levels), and/or using expert handscorers to determine the final score for student responses.

## Rescores

The rescoring process includes automatic rescores that occur during the scoring process, as well as parent-requested rescores that take place after the official scoring window. The rescores for all subjects will be performed by expert readers.

Please refer to LEAP 2025 HS Processing Rules - Scoring.x/sx on the LDOE Reporting SFTP site at /<2021> - LEAP 2025 HS Spring/Processing Rules - Final/ for a complete description of the rescore rules and process.

## DRC-MI Streaming Scoring Documentation

## DRC - MI STREAMING SCORING SUBMIT SERVICE DOCUMENTATION

NOTICE: The contents of this document and any references to external resources are intended for review only by representatives of Data Recognition Corporation, Measurement Incorporated, and LDOE, and are considered private. Technical specifications are subject to change.

REVISED: 2015-11-23; created

## CONTENTS:

SECTION 1 - General Information ..... 35
SECTION 2 - SCHEMA SUPPLEMENT ..... 36-38
SECTION 3 - STATUS CODE INFORMATION ..... 39
1.1 PURPOSE: Submit Service accepts groups ("batches") of constructed responses for processing by the MI Streaming Scoring product.
1.2 SERVICE TYPE: The Submit Service uses a standard SOAP web service interface.
1.3 INTEGRATION: Application-generated service definition (WSDL 1.1) document is available; WCF (Windows Community Foundation) client integration is also possible. The WSDL and WCF URLs for each environment are as follows:

## DEVELOPMENT

- WSDL:
- WCF:

## STAGING

- WSDL:
- WCF:

PRODUCTION:

- WSDL:
- WCF:
1.4 SERVICE SIGNATURE: The Submit Service provides a single operation SubmitBatch. The operation signature - request and response structure - is defined in the WSDL. The structure of each complex type, with field descriptions and expected value ranges is described below.
2.1.1 SUPPLEMENTAL SCHEMA DOCUMENTATION: The following tables are supplemental to the schema for the Submit Service, but are not, themselves, the schema. The service schema is contained within the WSDL, and may be emitted from that source to an XML schema document (XSD) through various means, though this will likely be unnecessary. To reduce confusion in terminology, the following tables will be referred to as the "supplement" or "schema supplement".
2.1.2 TABLE STRUCTURE: Each table documents a specific complex type defined by the Submit Service WSDL, with each row in a table representing a field of that complex type. Column definitions are provided here.
- Name: Name of field; note that for complex type fields, the name of the field and the name of the type may, or may not be the same.
- Type: Field type; this may be a simple type (string, integer, etc.) or another complex type, which is described in another table.
- Min: Minimum expected occurrences (minOccurs). This value with be either 1 or 0 for all fields. For fields with 0 minOccurs, that field may be omitted from the complex type, and it will still be schema-compliant. Omitting a field may still cause an application-level error due to invalid data, refer to the Range column for application-level constraints.
- Max: Maximum expected occurrences (maxOccurs). This value will usually be 1 or unbounded. Unbounded fields/elements may appear multiple time within the complex type, which allows for list-like data structures within the service. While there is no theoretical upper limit to the number of occurrences, some constraints are enforced at the application level. See the Range column for more information.
- Description: This column defines the field's purpose.
- Range: Application-enforced constraints on a field's value are given here. If the field has a minOccurs of 0 in the schema, but is expected to be included by the application, it will be designated required in this column. Fields with a maxOccurs of unbounded within the schema with an application-enforced limit will be described here. Strings will have their maximum expected length defined here, if any.

| 2.1 SubmitBatch (REQUEST ELEMENT) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Name | Type | Min | Max | Description | Range |
| request | SubmitBatchRequest | 0 | 1 | Application-defined request element | Required. |

2.2.1 SubmitBatchRequest

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :--- | :--- |
| Batchld | string | 1 | 1 | DRC Batch ID; no validation <br> performed by MI | Max length 50; longer <br> values will be <br> truncated. |
| Clientld | string | 1 | 1 | MI-Assigned client/project <br> identifier; other projects <br> sharing the environment will be <br> assigned separate Clientlds. | Only values provided <br> by MI will be accepted. |
| ConstructedResponses | ConstructedResponseList | 0 | 1 | List of constructed response <br> elements to be scored for this <br> batch | Required. |

### 2.2.2 ConstructedResponseList

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :--- | :--- |
| ConstructedResponse | ConstructedResponse | 0 | unbounded | List of individual CRs <br> to be scored | Required. Missing or zero- <br> length lists will not be entered <br> for scoring. Lists exceeding <br> 2000 CRs will also be rejected. |

### 2.2.3 ConstructedResponse

| Name | Type | Min | Max | Description | Range <br> EssayText string |
| :--- | :--- | :---: | :---: | :--- | :--- |

2.3.1 SubmitBatchResponse (RESPONSE ELEMENT)

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :---: | :--- | :--- |
| SubmitBatchResult | SubmitBatchResult | 0 | 1 | Application-defined result element | Required. |

### 2.3.2 SubmitBatchResult

| Name | Type | Min | Max | Description | Range |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Batchld | string | 1 | 1 | DRC batch ID as stored by MI (same value given in request) | Value may be truncated if it exceeds 50 characters |
| Clientld | string | 1 | 1 | Ml -assigned client identifier (same value given in request) |  |
| MIBatchld | ser:guid | 1 | 1 | MI-generated Batch ID | ser:guid is an extension of string, bounding the expected value to a Guid data type. It may be treated as a string or parsed to a Guid by the client. |
| StatusCode | StatusCode | 1 | 1 | Application-generated response code indicating success/failure of operation |  |

### 2.3.3 StatusCode

| Name | Type | Min | Max | Description | Range |
| :--- | :--- | :---: | :---: | :--- | :--- |
| Code | integer | 0 | 1 | Numeric status code | Required. Will fall in the range 0-999. See section 3 for more information |
| Description | string | 0 | 1 | Short description of status | Required. See section 3 for more information |

## SECTION 3 - STATUS CODE INFORMATION

3.1 STATUS CODES: Each SubmitBatch response will contain a status code indicating success or failure in adding the batch to the Streaming Scoring system. Individual CRs processed by Streaming Scoring will also receive similarly structured Status Codes upon delivery, albeit with similar values. Note that lowerlevel errors will not receive application-generated responses, and therefore will not be given status codes. These types of errors include (but are not limited to): malformed requests (which violate the schema), service unavailable, and TCP/HTTP errors. Expected status codes and their description for the SubmitBatch operation can be found in the following table.

### 3.2 SubmitBatch STATUS CODES

| Code | Description | Notes |
| :--- | :--- | :--- |
| 0 | SUCCESS | Batch successfully accepted and queued for scoring. |
| 100 | INVALID_CLIENT_ID | Clientld value in request is not valid. |
| 120 | NO_REQUEST_DATA | request element is nil or missing. |
| 140 | NO_ESSAY_DATA | ConstructedResponses element is missing or contains zero CRs. |
| 150 | BATCH_TOO_LARGE | ConstructedResponses element contains more than 2000 CRs. |
| 190 | INTERNAL_ERROR | An unexpected internal error occurred at the application level. |

### 3.3 Individual CR STATUS CODES

| Code | Description | Notes |
| :--- | :--- | :--- |
| 200 | too few words (configurable) | blank or extremely short response; response sent to DRC for <br> Supervisor Review |
| 220 | not enough correctly spelled words <br> (configurable) | "Indecipherable" (i.e., foreign words and non-words); response sent to <br> DRC for Supervisor Review |
| 400 | unexpected item_id | the item_id is not one of the items PEG AI has modeled; potential set- <br> up issue to be resolved between MI and DRC |
| 500 | Alert, otherwise same as 0, above | alerted response sent to DRC for Supervisor Review |
| 520 | Alert, otherwise same as 200, above | alerted response sent to DRC for Supervisor Review |
| 522 | Alert, otherwise same as 220, above | alerted response sent to DRC for Supervisor Review |
| 530 | Alert, otherwise same as 300, above | alerted response sent to DRC for Supervisor Review <br> the item_id id not one of the items PEG Al has modeled; potential set- <br> up issue to be resolved between MI and DRC; alerted response sent <br> to DRC for Supervisor Review |
| 540 | Alert, otherwise same as 400, above | sent to DRC for Supervisor Review <br> 605 |
| 610 | copied text low threshold (configurable) |  |
| 900 | copied text high threshold (configurable) | sent to DRC for Supervisor Review <br> timable to complete essay score prediction within time limits; sent to <br> DRC for Supervisor Review |
| 950 | system error processing essay | internal PEG error |

Page 46

## Appendix B

## DRC Distributed Scoring Process

| Web-based Platforms used | Description |
| :--- | :--- |
| ScoreBoard | Scoreboard is the same application used to <br> handscore student responses. |
| Moodle | Moodle is a Learning Management Tool used by DRC <br> as the interactive piece of remote training and <br> scoring through the Big Blue Button application. |
| Zulip | Zulip is the chat tool used in conjunction with <br> Scoreboard and Moodle to facilitate instant <br> communication between Scoring Directors, Team <br> Leaders, and Scorers. It is mainly used once training is <br> complete and live scoring has begun. |

## LDOE will have login access to ScoreBoard and Moodle to be able to join reader training sessions.

## Remote Technology Orientation

Supervisors and scorers go through a very thorough structured and layered remote technology orientation training of the DRC remote scoring process before beginning training on content. Scoring Directors (SDs) go through the training first, then Team Leaders (TLs), and finally scorers. This training is focused on security, the different platforms, and how to use them for remote scoring. Scoring from home is seen as an extension of the company, and a quiet area away from distractions and others is required. An entire day of the training is allotted to work out any technical issues and practice with the different applications. Users will work in the Chrome browser by navigating through the different tabs that they will keep open during a typical workday - Moodle Dashboard/Big Blue Button session, the Zulip chat tool, and two tabs of ScoreBoard (one for the Training/Qualifying/Recalibration application [TQR], with sets to take and notes to reference, and another one for scoring). The screenshot below shows these tabs (from left to right: Moodle, Big Blue Button, Zulip, and the two DRC INSIGHT tabs for TQR and scoring).

## Moodle and Big Blue Button

Users are engaged in training inside the general training program known as Moodle; however, most interactive parts of the training process happen within the Big Blue Button (BBB) application. Big Blue Button is a "plug-in" to Moodle that allows everyone signed in to the session to hear the presenter's voice, ask questions that can be heard by the group, share screens, and "chat." Most interactive training will occur only after users click the "Join Session" button in Moodle to open a Big Blue Button interactive training session.

Below is a screenshot showing the Moodle dashboard of a user who is assigned to a U.S. History project.

COURSE OVERVIEW
General Reader Resources

General Team Leader Resources

General Scoring Director Resources

ELA023 - Jayson Hallquist's US History Project - All Users

After the user selects the course for the project (in this case, ELA023 - Jayson Hallquist's US History Project - All Users), the following screen with the "Join Session" button will become available.

```
\leftarrow \rightarrow \mathrm { C } \text { Ims.drcedirect.com/mod/bigbluebuttonbn/view.php?id=6828}
LMS
```

ELA023 - Jayson Hallquist's US History Project - All Users

After joining the session, the user will be brought to the Big Blue Button screen where the interactive portion of the session will begin once the session leader has determined that all parties have joined.

Moodle is frequently used in college classrooms in a manner similar to DRC's use; like a professor leading a class, our Scoring Directors lead our group training sessions and guide the ongoing learning process. Moodle mirrors aspects of the scoring room and provides a versatile platform for training. It serves as a place to share files of important documents such as scoring statistics, non-secure training

Page 49
6.4.21 | DRC Proprietary and Confidential
materials (e.g. nonscore definitions), and application help manuals. Moodle also provides a communication tool for SDs/TLs to host discussions with scorers. Through their Moodle Dashboard (the home screen they see upon logging into Moodle), users can navigate through different courses created to reflect a structure to the scoring room. Only users who are assigned to specific courses, including Big Blue Button sessions, may see what is visible in terms of course materials. The Scoring Director's - All Users course is similar to the entire scoring room, the Scoring Director's - Supervisor course is where Team Leader meetings are conducted, and the Team Leader's breakout room is where TLs go to have one-on-one discussions with their scorers or work in small groups with their team.

## Content Training with Moodle and Big Blue Button

Scoring Directors will train the group within the Moodle Big Blue Button by screensharing PDFs of training materials as they progress through training. This ensures the audience has the clearest images of the training materials. Scorers are not permitted to download, print, or take screenshots of any confidential materials. All secure materials such as sources, rubrics, anchors, training sets, and/or qualifying sets will only be accessible to scorers and Team Leaders in ScoreBoard TQR (part of DRC's secure scoring platform), which does not allow anything to be downloaded or printed. (A copy of DRC's Scoring Security and Confidentiality Agreement, which all scorers must sign, can be found on the next page.) Supplemental documents that are not secure, such as nonscore definitions, will be located in Moodle where users may have the capability to download or print. When appropriate in the training, the Scoring Director will direct Team Leaders and scorers to take their TQR sets, following the same training flow as they would in a DRC scoring facility.

## DRC Remote Test Scoring Security and Confidentiality Agreement

I understand that, as a Remote Test Scorer and employee for Data Recognition Corporation, the materials I work with (scoring rubrics, training materials, test questions, student responses) are secure and confidential. It is DRC's expectation that Remote Test Scorers score on devices using up-to-date operating systems.

I agree to the following terms:
All DRC technology, processes, records and information related to DRC and its customers are confidential and must be treated accordingly. DRC or DRC related information, including without limitation, documents, notes, files, records, oral information, computer files, or similar materials may not be saved, duplicated or removed from DRC premises or systems without permission from DRC. Additionally, the contents of DRC's records or information otherwise obtained regarding business may not be disclosed to anyone, except where required for a business purpose. Employees must not disclose any confidential information, purposefully or inadvertently, through casual conversation, with any unauthorized person inside or outside DRC at any time while employed, between projects or after termination of employment. Employees who are unsure about the confidential nature of specific information must ask their manager for clarification.

By signing below, I agree that:

- all training materials and student responses are the property of DRC.
- requests for information about particular projects are referred to DRC management.
- commenting on the content of items (test questions) or responses with non-project related personnel is prohibited.
- reproducing, in part or in whole, through means including but not limited to printing, taking pictures, downloading, or capturing screen shots of student responses, test questions, or training materials is expressly prohibited.
- the privacy of the students whose work I evaluate is to be respected, and all related data is to be protected from disclosure.
- I will work in a private environment, separate from others and free from distractions.
- I will be the only one to read and score student responses that have been assigned to me.
- I will adhere to the criteria defined by the rubric and training that I receive.
- during work hours, I will only use my cell phone to contact DRC support.
- I will not discuss test questions, student responses, and training materials with anyone except my Team Leader and Scoring Director.
- I will not share test questions, student responses or training materials on any media, including social media.
- I will score only on a
- laptop or desktop; not on a cell phone or tablet.
- device using a current and supported version of a Chrome browser.

Furthermore, I understand that violation of any of these security and confidentiality policies will be subject to appropriate disciplinary actions, up to and including termination of my employment with Data Recognition Corporation.

## Name Printed

## Signature

## Date

## Remote Reader Training (Scorers)

- When scorers first log in to Moodle, they will enter the Scoring Director's - All Users course and join the Reader Training Session. They will also be assigned to a Team Leader, which they will see under their Moodle Dashboard. Each Team Leader will be assigned no more than 8 scorers for remote scoring. Scorers must be present each day of the training. The Big Blue Button set-up allows moderators of those sessions to track attendance via name/phone number sign-ins. All supervisors will be required to take attendance during the larger sessions as well as full team sessions.
- Scoring Directors will begin the training within Moodle and the Big Blue Button application with a thorough review of the scoring rubric, the prompt, sources, and annotated anchor papers.
- When scorers are ready to begin the first training set, the SD will explain the purpose of training papers, reinforcing the importance of using the Anchor set while assigning scores. The SD will instruct scorers to take each training set by navigating to their TQR tab within ScoreBoard which will record their scores electronically.
- Scorers will be given a suggested timeframe in which to finish each set.
- Scorers will electronically submit their scores upon completion and will be asked to use Zulip to inform their TL when sets are complete. After all the scores are submitted, reports will be generated. SDs will analyze group-wide trends and use that information to guide review within the Moodle Big Blue Button Session with all users.
- After the completion of each training set by scorers, the SD will announce the true score for each paper and discuss each response.

## Zulip Chat Tool

Once content training is complete, scorers will use the ScoreBoard tab set up for standard scoring to score student responses, just as they do when scoring on-site in a DRC scoring facility. They will also continue to have access to the sources, rubrics, anchors, training sets, and/or qualifying sets through the use of a second ScoreBoard tab opened to TQR. They will be in contact with their Team Leader and Scoring Director through the Zulip chat tool throughout the course of their day.

Zulip is the chat tool used in conjunction with ScoreBoard and Moodle to facilitate instant communication between Scoring Directors, Team Leaders, and scorers. The first day of remote technology orientation is used to set up accounts for this instant messaging communication. All users will keep a separate Zulip tab open and navigate back to the Moodle and ScoreBoard tabs accordingly. While in the ScoreBoard tab or Moodle tab, they will be able to receive notifications of Zulip communication. Each user will be enrolled in Zulip "streams," which are group message forums with set, pre-designated enrollments. All stream messages are seen by all who are enrolled in a particular stream and anyone enrolled can post a message. Streams will be organized much like Moodle. There will be a

Page 52
6.4.21 | DRC Proprietary and Confidential

Stream for All Users, representing the Scoring Director's entire group, one for Supervisors, representing the Scoring Director and Team Leaders, and Team streams for the Team Leaders and their scorers.

- Zulip is used for short messages, unrelated to content, such as:
- TL attendance notification. Scorers should send a private message to their TL every morning when they first log in, when they log out and come back from a lunch break, and when they log off at the end of a shift ("I'm starting my shift" or "I'm logging out for the day"). If the TL has not received a message within 5 minutes of the scheduled shift start time, the TL will send a private message asking if the scorer is logged in and ready to score.
- Scorers may ask their TL for scoring help by sending a private message to TL ("I don't know how to score lithocode \#\#\#\#\#\#\#"). As mentioned earlier, it is acceptable to reference lithocodes in Zulip but not specific response content.
- Scorers will receive team stream messages from their TL, like morning greetings or Moodle team meeting notifications.
- Scorers may receive a private message from their TL to set up a scoring conference in Moodle ("Meet me in the Moodle team room at 11 am to go over a few responses").
- Scorers may receive group stream messages from the SD to announce a group Moodle meeting place and time, scoring stats posting, break/lunch time, or log-out time.
- All users may receive company announcements in the PAS Announcements stream.
- Moodle should be used for group meetings such as training, individual and team scoring conferences, or any other content-related communication.

## Remote Work Scheduling

Remote work will adhere to the same work-day hours as scoring within a scoring facility, with scorers working core hours of 8:30 AM - 4:00 PM. The schedule's purpose is to provide the structure maintained from scoring on site to remote scoring, which also ensures frequent and regular communication while following a group-wide schedule. All users will join the large group Moodle session after returning from each break (10:30 AM, 2:30 PM). This is meant to be practiced for the first few days of scoring to keep everyone on the same page, practice with systems, and keep communication flowing. After the first few days (when the Project Manager and Scoring Director determine that things are moving along), these extra times can be cut out.

## Example of Daily Remote Schedule for Scorers

## 8:30 AM - Start of shift

- Use Zulip chat tool to notify TL of start
- Log into Unanet and record start time
- Log into Moodle
- Log into DRC INSIGHT Portal
o Check ScoreBoard dashboard for messages
o Review rubric and sources
o Begin scoring

8:45 AM - Morning check-in

- Join Moodle session for morning announcements from SD
o Morning check-in and review
o Begin/Continue scoring

10:15 AM - Morning break

- Log out of ScoreBoard for morning break (chat message from SD via Zulip)

10:30 AM - Return from morning break

- Join Moodle session
- Return to scoring (log back into ScoreBoard)

Noon - Lunch break

- Log out of ScoreBoard for lunch break (chat message from SD via Zulip)

12:30 PM - Return from lunch break

- Use Zulip chat tool to notify TL of return to work after lunch break
- Join Moodle session
- Return to scoring (log back into ScoreBoard)

2:15 PM - Afternoon break

- Log out of ScoreBoard for afternoon break (chat message from SD via Zulip)

2:30 PM - Return from afternoon break

- Join Moodle session
- Return to scoring (log back into ScoreBoard)

3:55 PM - Final check-in before end of core hours shift

- Watch for SD's end of the day chat message via Zulip
- Continue scoring until end of shift

4 PM - End of shift

- Use Zulip chat tool to notify TL of ending shift
- Log into Unanet and record end time
- Log out of ScoreBoard and the DRC INSIGHT Portal for the day

## Attendance Policy

DRC's attendance policy has not changed. Scorers need to be present for all training. Team Leaders are in constant communication (via Zulip) with scorers throughout the day to ensure they are present. If anyone is going to be late or absent, they are instructed to call Human Resources.

Human to human metrics are from DRC EFT scoring in Spring 2017.
Al to human metrics are from the MI 2017 model-building results.

- Al model was built in Fall 2017
- Included 2,500 responses from the Spring 2017 EFT
- Responses scored using DRC developed training materials
- $100 \%$ were scored by a second human reader and adjacent scores were resolved

## Al Model Building－Social Studies Grades 5－8 ERs（Spring 2021）

H to $\mathrm{H}^{1}$－Human scored 2016 Field Test sample of $\approx 2500$ responses per item．
H to $\mathrm{H}^{2}, \mathrm{H}$ to $\mathrm{H}^{3}$－Human scored targeted samples of $\approx 500$ responses per item were used to augment and retrain the original Al models from 2016 ．These samples came from spring operational responses and were intended to find high score points to add to the existing Al models for the purpose of retraining the models prior to operational scoring． H to $\mathrm{H}^{2}$ augmentation sample was scored in spring 2017． H to $\mathrm{H}^{3}$ augmentation sample was scored in spring 2019.
AI－Data based on holdout subsets chosen by stratified random sampling from the full $\approx 3000$ per item response count（2016 FT and 2018 sample）and excluded from the training process．

*QWK data is noted for item models built by Pearson for DRC LA scoring. The PARCC program does not require QWK data to be saved and stored each year, so Pearson does not have QWK data
retained in their archives for item models that were initially built for PARCC scoring. Pearson is required to meet the PARCC quality criteria and they are confident these items met these criteria.
**E05_L_VF821667 - Very few students received high scores on this prompt in 2019, so there were insufficient examples of 3s and 4s available to train the model (refer to Grade 5 ELA SPD history on page 73 of Appendix C). As a result, responses identified by IEA as possible score point 3 s and 4 s for this item will be sent to human scorers for scoring.

- Trait 1 = Reading Comprehension and Written Expression or Written Expression
- Trait 2 = Conventions
- Blue indicates IEA-Human performance higher than Human-Human performance
- Green indicates IEA-Human performance is within $5.25 \%$ of Human-Human performance
- Orange indicates IEA-Human performance is more than $5.25 \%$ below Human-Human performance
- Source - Pearson

Condition Code notes:
dition codes B F I and U (Blank, Foreign Language, Insufficient, and Unintelligible) were in use for ERs and CR
Spring 2019 - Condition codes B, F, I, N, R, and U (Blank, Foreign Language, Insufficient, "I don't know," Refusal, and Unintelligible) were in use for ERs and CRs. In addition, in Spring 2019, the definition of condition code " $l$ " was broadened to include copied text response types that would have been scored as 0 s in previous years.
**ER 965286 FT item was re-scored in October 2018 using updated rubric
***Spring 2019 - DRC conducted supplemental FT scoring for CR items 965190, 965222, and 965279

## Condition Code notes

Spring 2018 - Condition codes B, F, I, and U (Blank, Foreign Language, Insufficient, and Uninteligible) were in use for ERs and for CRs.
Spring 2019 - Condition codes B, $, 1, N, R$, and U (Blank, Foreign Language, Insufficient, Idon't know, Refusal, and Unintelligible) were in use for ERs and CRs. In addition, in Spring 2019 , the definition of condition code "l" was broadened to include copied text response types that would have been scored as 0s in previous years.

## Form Key: Form C_S = Administrative Error (AE), Form F_S = Operational

*Condition Code notes:
Spring 2017 - B (Blank) was the only condition code in use for ERs and CRs
Spring 2018 - Condition codes B, F, I, and U (Blank, Foreign Language, Insufficient, and Unintelligible) were in use for ERs while B (Blank) was the only code in use for CRs
Spring 2019 - Condition codes B, F, I, N, R, and U (Blank, Foreign Language, Insufficient, "I don't know," Refusal, and Unintelligible) were in use for ERs and CRs. In addition, in Spring 2019, the
definition of condition code "l" was broadened to include copied text response types that would have been scored as 0s in previous years

[^0]:    ${ }^{1}$ In the spring of 2016 and 2017, PARCC item parameters were used to place the LEAP 2025 assessments on the PARCC scale. In the spring of 2018, PARCC items that had been previously administered in Louisiana were available, so the item parameters generated from Louisiana students were used to create the LEAP 2025 scale. The LEAP 2025 scale is comparable to the PARCC scale. Future LEAP 2025 assessments will be linked to the spring 2018 LEAP 2025 scale, which is considered the baseline.

[^1]:    ${ }^{2}$ Item associations were determined by PARCC/Pearson with the understanding that aspects of training are generalizable across similar items. For mathematics, the determination of prototype versus abbreviated items was made by PARCC and Pearson based on similar item types and by evidence statements. For ELA items, this determination by PARCC and Pearson was based on grade and task type.

[^2]:    ${ }^{2}$ PEG's agreements are based on a hold-out validation set pattern, as opposed to a cross-validation pattern. Crossvalidation was evaluated in the past, but MI has since learned that hold-out validation provides (1) equally valid models with a massive improvement in training time, as well as (2) an easy way to ensure that the validation set remains partitioned from the rest of the training set at all times.

[^3]:    Form Key: Form $\mathrm{BR}=$ Administrative Error (AE), Form E = Operational

[^4]:    Condition Code notes:
    Spring 2018 - Condition codes B, F, I, and U (Blank, Foreign Language, Insufficient, and Unintelligible) were in use for ERs while B (Blank) was the only code in use for CRs.
    Spring 2019 - Condition codes B, F, I, N, R, and U (Blank, Foreign Language, Insufficient, "I don't know," Refusal, and Unintelligible) were in use for ERs and CRs. In addition, in Spring 2019 , the
    definition of condition code "I" was broadened to include copied text response types that would have been scored as 0s in previous years
